Hi Len
You're on. Send me the drive by priority mail. Tell me how much the shipping cost. My address is: Headley Sappleton
187 Coral Dr, Claymont, De 19703. For the first time I will only go for the 11gs 3.5" floppy drive. If this works out well, I may want the 11gs and software for it. I do have programs like PageMaker, and Adobe Illustrator, etc. Reply first and let me know what you are doing.

Regards
Headley

3511. Atari computer games with comic books?

Newsgroup: comp.sys.atari.8bit
Date: 1998-10-27 00:00:00 UTC
From: Fredrik Ekman <ekman@lysator.liu.se>
Message-ID: <dwpvbeukbn.fsf@sally.lysator.liu.se>
Source record: 58975

Hi!

I just recently learned that several Atari 2600 video games were shipped with comic books and would like to know if the computer versions of same games were likewise. The list of games follows:

Defender (Atari, DC)
Berzerk (Atari, DC)
Star Raiders (Atari, DC)
Phoenix (Atari, DC)
Galaxian (Atari, DC)
Centipede (Atari, DC)
Dig Dug (Atari, DC)
Swordquest: Earthworld (Atari, DC)
Swordquest: Fireworld (Atari, DC)
Swordquest: Waterworld (Atari, DC)
Yars' Revenge (Atari, DC)
Action Man: Action Force (Parker Brothers)

I suppose a number of these (Swordquest, Action Man) were not even released for Atari computers but most, I believe, were. So: were any of these games shipped with comic books for the Atari computers?

Were there any other Atari computer games that shipped with comic books?

/F

3512. Re: 8 bit demo competition Rules

Newsgroup: comp.sys.atari.8bit
Date: 1998-10-27 00:00:00 UTC
From: w_gayk@NOSPAMbielefeld.netsurf.de
Message-ID: <MPG.109fe36e6954ae31989716@news.uni-x.net>
Source record: 58976
Cross-posted to: comp.sys.acorn,comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.sinclair

My suggestions:

Any 8 bitter is allowed (also NES and PC's), But limited to 6 Mhz Clockrate, to have a somewhat fair competition.

Hardware:
Stock Unit, Floppy/Tape, Color/Monocrome Monitor. That's all.
No Cartridges, no memory-enhancements, no turbocards and no soundenhancements (eg. Synergy Sid card for plus/4).

Voting:
The whole crowd votes, but votesheets contain the Scene the voter belongs to.
Scene dependant Percentage-voting: Means, if 1 of 10 CPC-sceners votes atari, Atari gets 10 percent from the CPC-Scene. If 100 of 1000 C-64 sceners vote Atari, Atari gets 10 percent from the C-64 Scene.
So we avoid that a big scene has too much influence, just because of its size.
To avoid selfvoting, selfvoting is NOT allowed. Means: Atari voters vote for C-64, Spec and CPC, but not for Atari-Demos. C-64 voters vote Atari, Spec and CPC, etc, but no C-64 Demo.

To get a clear overall impression AND to avoid mass-contributions we limit the amount of demos to 5 Contributions per System.

The Demo doesn't need to be unreleased. To be fair, we let each scene chose it's contestants. As a C-64 Scener I would probably chose "Dutch Breeze/BML", "Tower Power/CML", "Parts/Oxyron", "Last Traktor III/Horizon" and "Spasmolytic/Censor" to compete for C-64.
With this rule we get the best demos from each system to show real abilities, not just the abilities of one or 2 lazy coders who try to code a fast crap demo for this competition.

All Demos will be recorded on VHS-Video to avoid Problems with Videobeamer-connections.

Wouldn't that be a proper rule for... eeeehh maybe TP 8 in Denmark?

ABOUT THE CANON BJ200

Yes it will work. I used to use mine with it before the printer blew itself
up. One of the DIP switches on the top of the printer controls
Linefeeds.
The switch functions are listed inside the front printer cover.

And if all dragon owners (yes all 1 of them!!) votes speccy, then the
speccy scene get 100% support from the dragon scene???? Also, will the
6mhz limitation include underclocked comps? or compss running at there
normal capacity

So no PcW16? Why not just limit it to 'any computer which uses an
8-bit data bus'? Don't forget that the machines with faster
processors tend to have to shift more memory around on the screen so
things balance out.

Incidentally, my proposed '8-bit data bus' rule disqualifies PCs
unless they have an 8088 or 80188 CPU.

As to your idea of having an award for 'best use of hardware',
unfortunately, the vast majority of 8-bitters are unaware of the
capabilities of other platforms and would not be able to make an
informed decision.

Hello,
I just came across a mint condition Atari 2600.
Only problem is the cord to the TV/Antenna part is cut clean.
I spliced it and the picture is terrible. Is there one that I can use that is compatible with the new cable ready tv's?
The picture kinda "bounces" up and down, what could this be?
P.S. this system was still in the box....very very good condition.
Thanks,
Eddie (Boston Ma. U.S.A.)

Brix wrote in message ...
:
:My suggestions:
:
:Any 8 bitter is allowed (also NES and PC's), But limited to 6 Mhz
Clockrate, to have a
:somewhat fair competition.

That's not a particulary good way of limiting speed though, is it? I mean,
everyone who has been even vaguely following any of these threads should
know by that a 6Mhz 6502 would be faster than a 6Mhz Z80. The same goes for
other processor flavours.

:Hardware:
:Stock Unit, Floppy/Tape, Color/Monocrome Monitor. That's all.
:No Cartridges, no memory-enhancements, no turbocards and no
soundenhancements (eg. Synergy
:Sid card for plus/4).

Sounds fair to me. By "No Cartridges" I presume we aren't excluding them for
NES demos. :) Or to supply BASIC to a CPC+ (which wouldn't do anything
without one) or other machines which absolutely have to have them. Just
things like Fastloader cartridges or Sideways ROMS.

:Voting:
:The whole crowd votes, but votesheets contain the Scene the voter belongs
to.
:Scene dependant Percentage-voting: Means, if 1 of 10 CPC-sceners votes
atari, Atari gets
:10 percent from the CPC-Scene. If 100 of 1000 C-64 sceners vote Atari,
Atari gets 10
:percent from the C-64 Scene.
:So we avoid that a big scene has too much influence, just because of its
size.
:To avoid selfvoting, selfvoting is NOT allowed. Means: Atari voters vote
for C-64, Spec
:and CPC, but not for Atari-Demos. C-64 voters vote Atari, Spec and CPC,
etc, but no C-64
:Demo.

But smaller scenes get a bigger influence? And what about people who sort of
belong in two scenes, do they have to choose one, or are they excluded from
both?

:To get a clear overall impression AND to avoid mass-contributions we limit the amount of
:demos to 5 Contributions per System.
:
:The Demo doesn't need to be unreleased. To be fair, we let each scene chose it's
:contestants. As a C-64 Scener I would probably chose "Dutch Breeze/BML", "Tower
:Power/CML", "Parts/Oxyron", "Last Traktor III/Horizon" and "Spasmolytic/Censor" to
:compete for C-64.
:With this rule we get the best demos from each system to show real abilities, not just the
:abilities of one or 2 lazy coders who try to code a fast crap demo for this competition.

Well, I really don't think mass contribution was ever going to be a problem, especially if the demo has to be written in assembly. Also if released demos are allowed then its unlikely we will see any new demos, unless the deadline is ages away. Who wants to try to compete with say Shock on the Speccy, or Logon's The Demo on a CPC. However, if they are excluded people might try a little intro type demo, or something.

:All Demos will be recorded on VHS-Video to avoid Problems with Videobeamer-connections.

How? Sure its easy for machines like the Speccy and C64 which broadcast their piss-poor displays to a TV, but those with proper graphics *have* to use a monitor. Are you supposed to sit in front of the screen with a camcorder, trying to get a decent picture of the display? Are people supposed to base their decisions on a fuzzy, out of focus picture?

Furthermore, how are people going to see these videos? I know, maybe we could turn them into multi-megabyte mpegs or avis and upload them to a website. Of course if we had restricted tricks to what an emulator can mimic we wouldn't have this problem, now would we.

What the hell is a Videobeamer anyway?

:Wouldn't that be a proper rule for... eeeehh maybe TP 8 in Denmark?

Eh? What's TP 8? Is it some sort of convention? If so, why don't people just take machines along instead of pissing about with videotapes?

Howdy Vinnie

Don't forget that most printers only look at the DIP switches when the printer is turned on! I've got a Canon 4200. It has NO dip-switches. (but I have a BlackBox, which has a menu to cure this). Stupid thing with those modern printers is, that they are intended for the average PC user.

On the 850, you might have to switch on "light translation". But please don't ask me how.

BTW on the Canon 4200 you can change some settings by switching it on an holding the power button. It will then start to beep. If you remember correctly, you let go of the power button after a certain numbers off beeps. The 4200 only has two buttons, power and resume. Had to "shorten" the page height from 22 to 12 inches. Other wise it split up a DaisyDot III page in two .

```
65816 cross assembler xa65

The new version of the 6502 crossassembler now supports

65816 opcodes!

The assembler is under GNU public license and can be found at:
http://www.tu-chemnitz.de/~fachat/8bit/cross/xa/index.html

General description:

- C-like Preprocessor to make macros
- label "hiding" on different levels,
i.e. multiple use of the same label possible
- 1.5-pass assembler:
Everything that can be derefenced is being assembled in pass 1 and
saved in memory. The second pass does the rest. This (together
with hashing etc) gives quite a good speed (30kByte binary out of
300kByte source in less than two minutes on an 8MHz Atari ST -
hey, the first versions would have taken half an hour for this
job! - my 486DX4/100 with linux needs around two seconds or so...)
- needs no linker - all stuff is in source code (with this speed,
it's ok)
- (optional) support for relocatable 'o65' file format,
including linker, relocator and file utility. A loader in 6502
assembly code is also included. 65816 is not yet supported here, though.
- reads DOS and Unix(tm) files (LF or CR+LF)
```

so long

Do you happen to have that part number? When I contact Syquest, what do I
ask for?

Are you talking about the RF connector that the atari cable plugs into or the
cable from the atari to the RF switchbox? If it's the atari side that cable is
easily replaced. Just open the unit and you will see the end on the circuit
board is a standard rca phono connector.
The original atari's didn't have a channel select switch and only work on
channel 3. Then they added a switch for channel 2 or 3. Try both.

>Computers does exist a program that is called XL DeeJay. It does
>exactly this job! Why not to find out how it works and program an own
>program for the amiga?

The easy method: Connect the XL over the interface box (a 850 or 850XL) with
the serial line with the Amiga. That's how it works here. I could offer, too,
programs to transfer data from Amiga to Atari and the other way 'round.

The hard method: Build a tiny hardware that connects the Atari interface
(using TTL levels) with the Amiga serial line (using RS-232 levels, i.e.
+/- 12V), then write a program on the Amiga side emulating a disk drive.

I also build an interface like this and could send you the shematics in case
you're interested in it. However, requires some experience in soldering.
(Not on the computers directly, but to build the interface...)
The interface was supposed to be driven by software from the Amiga side,
which then would have to emulate disk drives and somewhat more. A partially
working C source is available for this program which will already emulate
disk drives. However, I never completed the program due to lack of interest
and the easier solution pointed out above. In case someone wants to continue
with that project, just drop me a line...

So long,
Thomas

Message-ID: <2hKZ1.4861$U4.893587@news.tpnet.pl>
Source record: 58905
Cross-posted to: alt.atari-jaguar.discussion,alt.emulators.ibmpc,comp.sys.atari.8bit,comp.sys.cbm,rec.games.video.arcade

Hello,

Me and my friend have setup some free service for
european collectors and users of Arcade Machines,
Old Computers and Consoles. We decided to provide
this service after we have searched for pages that
could help us to buy some old hardware. AFAIK there
are very few sites in Europe that help with that.
Anyway, please take a look at this url:

http://www.mirage.com.pl/nostalgia/rgvac.html

you will find there some auction boards that can
be used for free by anyone who wants to buy or sell
mentioned items. I am planning to add some message
boards if there will be a demand for that (ie the
page will seem to be useful for people).

All comments, ideas and suggestions are welcomed!

Please send comments to ChillZ (my e-mail address
can be found at the given url).

Thank you,

ChillZ (on #emu on IRC net)

Okay, this is a long shot, but...

Does anybody have a 'Music Construction Set' (Electronic Arts)
disk for sale and ALSO as a disk image?
I want to buy the disk for use with an emulator, but I don't
have a way to transfer the disk (too darned lazy to build a
cable).

I'm not looking for pirated software, as I'm willing to buy
the disk from someone, I just want whoever sells it to me to
also supply a PC disk image.

thanks!

3547. Anybody remember the demo "Jane's program"?

Newsgroup: comp.sys.atari.8bit
Date: 1998-10-28 00:00:00 UTC
From: Peter Hirschberg <peterh@REMOVEcronuscom.com>
Message-ID: <7184co$qr7$1@clarknet.clark.net>
Source record: 58915

Does anybody remember a demo called "Jane's program"?

It featured a box that user moved around on the screen with
the joystick. When you pressed the fire button, different
colored "squares" would drop from the box and bounce on the
bottom of the screen, with each color making a distinct musical
note when it hit the bottom. You could pick up the squares
laying on the bottom of the screen, and drop them again
with the fire button. The boxes dropped in the order that
you picked them up, so you could almost create little 'tunes'.
Pretty neat.

Anybody have/remember this program?

Thanks!

-)> Sinclair QL?
-)...has an 8bit databus.

Yup, a 68008.

That would beat the other computers, except that the QL sucked mightily
when it came to graphics and sound. Sinclair really knew how to woo
customers, and how to fit 100% of the components on the circuit board...

[demo competition]

Just limit the entries to computers which are commonly taken to be 8-bit,
have keyboards, and were reasonably popular somewhere in the world
sometime. If a million New Brains were sold in Dubai, then they can enter
too... I take reasonably popular to mean had several releases by top
software houses (of the time), and sold >10,000...

A special entry can be created for souped up computers, so those 10MHz
Enterprise 64's can enter.

1k demos, 4k demos and full size demos.
Best Slideshow / music disk.

How about an award for best serious software? This is just as valid,
because some 8-bitters were more suited to this than games. I suppose CPM
has to be banned though, or entered as a platform in its own right.

Graham

Why doesn't Pine recognise comp.sys.acorn anyway?
I wonder what great demo effects can be created on an Aim65?

Well the Atari C: handler automaticly compensates for stretching.
When you first start loading a tape file and you hear that first whine
(packet/block/sector of data)
that sounds different from the rest,thats the calibration block that
allows the Atari to adjust the baud rate (default:600) to match the tape
exactly.

From: ALF <ethernyet@aol.com>
Message-ID: <719068$b6b$2@supernews.com>
Source record: 58920

Hi, I recently acquired an Atari SX212 modem without any manual, software, cable, or power supply. I was wondering if people out there had info. on this modem? I'd imagine I could get a generic A/C adapter, but I don't know the voltage. Is it Hayes compatible? Is the AT command reference & default config. info. online somewhere? Also, it appears to connect to either an 8-bit or 16-bit Atari machine? Finally, by the"212" moniker, I presume it is a 1200 baud modem?

Thanks a bunch, everyone...

ALF

There was/is something sold in audio stores called Tweek, which you dabbed on your stereo's connectors to get a better connection. Should work on computer type connectios as well.

Well you have Asteroids being redone as well BUT so far I have not seen
an update I like. Battelzone was ok...but M.Z's has been panned from
what I hear.

Just proves, 3D graphics, a PII 450 and 500megs of HD space don't always
make a game :)

I found some usefull programs in my diskbox. But they are under the
MultiBoot 'filesystem. Plus that i only can load them with a 400/800
emulator.
I can convert a menu item to boot disk. Is there a converter to file?
And where can i get it!

Louis

Are there any archives for Programs from Atari Magazines?

Magazines such as Compute!, Analog, Antic (other than the official site)...Even if I still had all my old mags I no longer would have the time to type them all in.

On a related note, my memory fails me now, what was the Atari Program Exchange again? I downloaded Dandy and the answer is on the tip of my tongue...

Considering in 1986 and 87 with either a 300 or 1200 baud modem it took me
two years to collect about 600 disks. Now I compare that to a T1 download of
a few mega images in about an hours time.

Thanks to this I realize I had way too much spare time back then :)
I for one appreciate those mega images :)

Huh, that would mean we need a minimum of voters for each scene - thanks for this hint.
I think I had the Stock computer - rule, which means "not overclocked" "not underclocked"
- just the clockrate it has usually without modification.

Not bad either, but I'd prefer the 8bit processor rule - the adressbus size is rather hard to find out on exotic machines.. those dudes could tell you anything.

The best use of hardware can't be found out by the public, that's true.
Most C-64 sceners don't know about mode-splitting on CPC and most CPC-Sceners probably don't know about the difficulties of high-color-density in C64-Graphics or Sprites-over-FLI tricks.
My intention was more to give an award for the "BEST LOOKING EFFECTS MADE WITH AN 8 BIT MACHINE" than giving an award for best use of hardware.

That would be C64/128,Spectrum,Amstrad CPC464/664/6128, Atari 800Xl (and it's little brother), Spectravideo (MSX).

> 1k demos, 4k demos and full size demos.
> Best Slideshow / music disk.

1k Demos are rather useless, they only show coding abilities, and too less Graphic-abilities.

When we do such competition on a usual eent, like TP8, Mekka/Symposium or so, we won't have time for various competitions. We have to get it all in one.

Full size demos provide all - good music, good GFX, good code.
This is why I suggested that each scene sends a choice of 5 of their best demos ever released to the competition.
Note: The Effect counts - no matter how hard the code is, if it looks ugly, it will me misjudged by the voters.

> How about an award for best serious software? This is just as valid,
> because some 8-bitters were more suited to this than games. I suppose CPM
> has to be banned though, or entered as a platform in its own right.

Not bad, but how do you compare POVRAY to LIGHTWAVE 3d or even Lotus123 for example? I have problems with this, because you cannot judge by the amout of features (a GFX-Program that also rubs you dick, switches the TV on/off and controls your CD-Player isn't really what I call a good GFX-Program, when it has one brush only).
You can also NOT judge the usability, because some prefer A mouse with GUI, some prefer Key-shortcuts, some Pulldownmenus, some windows... the more you get used to the software the more you'll like it maybe (or not).. judging the usability requires a fair experience, which is pretty hard to gain during a short competition.

Yes, but do you want someone to compete with a 20Mhz clocked 8-bit machine (if there was one).
This is just to eliminate too fast machines. Most stock units are in this area anyway (3,5 Mhz spectrum, 2 Mhz C128, 1 Mhz C-64)
Note, I'm talking about stock units. Others are not allowed.

> :Hardware:
> :Stock Unit, Floppy/Tape, Color/Monocrome Monitor. That's all.

NES has no floppy-drive, nor has an ATARI 2600. We make exceptions of the rules when the machines have nothing but a cartridge port, also when the machine needs a cartridge to work (like the mentioned CPC+ or TI66)

Chose one.
Other ways would be excluding all competing scenes from voting and letting the PC community decide or letting the whole Partypeople vote (of course still no selfvoting allowed).

I think to show the best of all is the best solution. So we get a clear impression what is possible, and not what os possible in time. Let the best compete with the best. No deadline.

> :All Demos will be recorded on VHS-Video to avoid Problems with

> supposed to base their decisions on a fuzzy, out of focus picture?

Here is the reason why all should be on Video. A SCART-Plug always gives a fair picture. I doubt there will be any 8-bit machine that needs more than this.
Btw: On a videobeamer every picture (even from PCs) is a bit blury as the limit goes for all machines it isn't such a problem...

> Furthermore, how are people going to see these videos? I know, maybe we
> could turn them into multi-megabyte mpegs or avis and upload them to a
> website. Of course if we had restricted tricks to what an emulator can mimic
> we wouldn't have this problem, now would we.

The competition will be held on a usual convention. So no need to upload it anywhere.

> What the hell is a Videobeamer anyway?

A machine that throws the picture, seen on the monitor or TV-screen to a Wall. Cinema-size. So the whole voting Public in the competition room can see it.

> :Wouldn't that be a proper rule for... eeeehh maybe TP 8 in Denmark?
>
> Eh? What's TP 8? Is it some sort of convention? If so, why don't people just
> take machines along instead of pissing about with videotapes?

[TP8]
Yes it is a 3-days convention held around christmas in Denmark.

[videotapes]
On those conventions there were always problems with connecting all the different machines (Pc,Acorn,C-64,Amiga) to the Videobeamer, because of different plugs and signals. So now the standard for all non-PC's is to record the Demos on VHS a short time before the competition.
This is done by the Organizers of the Party together with a guy who has the knowledge and who brings the machine to play the demo.

Thank you for the info...I'll be spending some time downloading these...There were a lot of games there that I have been looking for. I'm a happy man :)

One more question...I didn't see Castle Wolfenstein or Beyond Castle Wolfenstein. Does anyone know where those two games are? If I can find those, my "collection" will be complete. Thanks again. ~Pete.

Yup just might.. but maybe by then I'll be able to run bounty bob correctly!
;))

And I really liked battlezone! great value! (I got mine for $24.95)

centipede looks interesting, and asteroids sounds great!!

Now where the hell is a 90's version of rescue at fractalus?? Talk about a
great concept that could take great advantage of 90's 3d technology!!

Has anyone played around with this? More importantly, played around with it and gotten it to work? I built the interface and it's not going to well. The situation:

1) I got the program to run fine. But loading any of the included samples and trying to play them results in an _extremely_ distorted sound. I can barely make out a basic rhythm in Ghostbusters.

2) Testing the interface: it won't read any sound unless the input level is _extremely_ high, and then it is distorted. If I lower the level, it cuts in periodically (presumably when it peaks over the threshold) and what does come in is also distorted. Any ideas/thoughts/comments?

Aaron

>other hand, love my ATARI more every second I use a PC!!)

Yeh.There's a programme called DCMTOATR (or DCM2ATR?) on the IBM that converts DCM files to ATR files in SECONDS!
And,if you don't have total success with that,you can always run DISKCOMM from within the emulator.I use PC Xformer for this since it can use files DIRECTLY as well as those in ATR files and it's the fastest emulator.

And,of course,ATR files were never meant to be used on BBSes or FTP sites. They're simply too big to download.They aren't compressed at all.And there's no way to know if they get corupted.Plus the only way to download them is to have a disk drive that can handle disks bigger than the one the ATR contains.Or else use that programme that XMODEM (not CRC!) downloads the file directly to the disk's sectors rather than to a file.Files should be put in seperate ALF files.Disks should be put in DCM files which you might ALF as well.
(Bob Puff's SuperUnARC handles ALF files as well as SpartaDOS X's ARC)

I'm tired of seeing the megabyte ATR files containing all these games I want.

Hello ,
the SX 212 is a fully hays compatible RS- 232 1200 baud modem it was made for the 16 bit machines and for Atari PC's I have a 212 stored away. I'll do so digging and see if the manual lists and unusual commands, But if I recall correctly the command set set pretty much matched the hays and Supra offering of the time. I'll also check my power supply and get the current specs off of it.

Harold Alley Jr.
AtariPC

If Atari made it I should have it... somewhere. Supporting the Fuji since '77

Of course, the collary to this is.... since I made those ATR's myself
and made them available to others (via ZIP) for APE users, and for
myself, ATR is the format of choice for me. Why should I run a
converter when I don't have to? Why cant the emulators and APE use
DCM's directly? Then, there would be a choice.

>
>I'm tired of seeing the megabyte ATR files containing all these games I want.

Almost all of those games are available separately from a few sites,
since that is where I got them from to put on the mega images. The
mega images were created for my convenience. Obviously there is no
easy way to use them on a standalone 8 bit system but they work great
in Ape.

Maybe it is assumed that people crusing through these internet newgroups are using something more powerful than an Atari8 to do it, and so ARE able to handle files quicker on a quicker machine.

Would ALL people who are reading this newsgroup using nothing more than an Atari 8-bit computer (however enahnced) please reply and state so.

Actually, you're both right. The 815 was a double-density dual drive, with
two SS/DD mechanisms stacked on top of each other.

Atari did release the commented 400/800 source code; it's available from
vendors like Best Electronics or B&C (http://www.myatari.com) I don't know
of an _official_ Atari 800xl source listing, but the later editions of
Mapping the Atari did include some xl/xe OS specific information, including
addresses for some routines (both new and moved from the 400/800).

Hope this helps.

There is a two-part article about the Futura
magazines. It is not specific, but it implies that
all are available Page 6. The final issue (21)
evidently had a "goodbye" from Stuart Murray.

Maybe if you removed the simms and used 8-bit ISA cards for memory...
Anyone who would go to all that trouble to win an 8-bit competition
should be in therapy. But seriously, some Tandy PCs had an 80286 CPU and
an 8-bit bus.

Or, check out the Xetec Graphix AT. Plugs into the SIO port (no pass-through connection) It offers Auto line feeds, 155 conversions, Atari character graphics dumps, and forcing Bit 8 low all frop its own DIP switches. (Only problem now is that it only has a 6 foot cable - and my printer is 20 feet away!)

-)I don't know that machine - would it be a problem?

No, it runs a 6MHz Z80B, and is a portable machine from Amstrad released a few years ago. It even had TV adverts. Sort of like a cross between a palmtop and a laptop, it had a 2 colour LCD screen, and simple easy to use software. Dunno what facilities exist to program it except for the built in BBC BASIC. Perhaps it had inline assembler. If it did I might like to get hold of one sometime. I am sure that some pretty fast effects could be done on a small (640x100?) monchrome screen.

I don't know about the NC200.

Graham

-)That would be C64/128,Spectrum,Amstrad CPC464/664/6128, Atari 800Xl
-)(and it's little brother), Spectravideo (MSX).

Yep. also the CPC+, Sinclair ZX80/81 (with 16k RAMpack allowed!), PET,
Apple II etc. MSX is a strange one, some MSX's came with laser disk
players and midi keyboards and the like, and they could be quite a
force...

-)1k Demos are rather useless, they only show coding abilities, and too
-)less Graphic- abilities.

I suppose so. 4k demos could be interesting - no pregenerated graphics, it
has to be done on the fly.

-)When we do such competition in a usual event, like TP8, Mekka/Symposium
-)or so, we won't have time for various competitions. We have to get it
-)all in one.

I suppose everybody is waiting for the PC and Amiga demos to come on.

-)Full size demos provide all - good music, good GFX, good code. This is
-)why I suggested that each scene sends a choice of 5 of their best
-)demos ever released to the competition. Note: The Effect counts - no
-)matter how hard the code is, if it looks ugly, it will be misjudged by
-)the voters.

It would be nice to have some new demos though, showcasing the old ones is
valid as they would prove what machine was best at making good looking
demos over all time.

-)> How about an award for best serious software? This is just as valid,
-)> because some 8-bitters were more suited to this than games. I suppose CPM
-)> has to be banned though, or entered as a platform in its own right.

-)have problems with this, because you cannot judge by the amout of
-)features (a GFX-Program that also rubs your dick, switches the TV
-)on/off and controls your CD-Player isn't really what I call a good
-)GFX-Program, when it has one brush only).

Well, for an 8-bit computer, not CPM, the serious software was more limited and had to do what it had to, so there were very few over-featured programs. The CPC had the best 8-bit wordprocessors (Protext / Brunword) although I am unaware of the AppleII contenders, and the BBC had some good ones.

-)You can also NOT judge the usability, because some prefer A mouse with
-)GUI, some prefer Key-shortcuts, some Pulldownmenus, some windows...
-)the more you get used to the software the more you'll like it maybe
-)(or not).. judging the usability requires a fair experience, which is
-)pretty hard to gain during a short competition.

Hell, a program without keyboard shortcuts must be crap :) . It depends on the application, graphics programs like Advanced Art Studio were at their best with a mouse and Pull Down Menus etc, but that is just crap when it comes to WP (well, now advanced text editors). I agree that a competition is too short a time though to judge programs like this. Suppose a newsgroup vote would be the best way...

Howdy Yogi

Did I step on you toes? Hope not! I was talking about files I downloaded from
Eastern European sites. And I do not know if those can be found on other sites
in Atari 8 bit readable format. But what's the use of uploading bigger files
(ATR's etc. are larger then DiskComm files) when everybody is using ZIP instead
of ARC because it has better compression. And as I said, running a converter
on a PC is way faster then on an Atari 8bit.

Howdy Mark

A PC can turn a DCM file into an ATR file in (I guess) 30 seconds. An Atari 8 bit need atleast ten times that much (very carefull estimate).

Please think about MY spare time.

Howdy folks

If you own an XE computer and want to upgrade.....WAIT.

I seem to have found a way to stuff 1MB into my XE without loosing separate
ANTIC and CPU bank access. I'm still testing, but MyDOS recognises imidiately
(when using Option "O" in the menu"). At the moment neither VTOCFIX nor the
TASKMASTER in the BlackBox see it. Anybody have a clue??

>to find out on exotic machines.. those dudes could tell you anything.

You can always tell the width of the data bus from what CPU the
machine has. The address bus likewise, but we're ignoring that.

For example, all Z80s have an 8-bit data bus.

>My intention was more to give an award for the "BEST LOOKING EFFECTS MADE WITH AN 8 BIT
>MACHINE" than giving an award for best use of hardware.

Unfair, as some machines are far better suited to good looking effects
than others. eg, the C64 would beat the NC100 every time.

: to do if using packaged software....

: Thanks...
: Vinnie

Under "Printer Software Operation", page 84 of my 850 Operator's Manual states, "The Interface Module translates EOL into ASCII CR (Carriage Return, 13 decimal). No other translations are made."

Most printers have dip switches or configuration memory to set line feed with CR. If your printer MUST have both a CR and LF it won't work from the 850 printer port. I think the Supra MicroPrint interface generates both. You might be able to find it at ATV or B&C. Read the FAQ for a vendor list at:

www.faqs.org/faqs/atari-8-bit/faq/

Steve,

I have a working keyboard, but it is attached to a working 800 computer. It's a spare, so depending on what you're willing to pay, I might take the keyboard out of it.

By the way, what is the problem with your keyboard? I've found that reluctant keys can be revived by taking the keyboard apart and gently massaging the contact pad with a smooth hard object.

Sincerely,
Gail

Don't forget, that nice GFX are not all that makes a demo.
Also note that good GFX often require more CPU-time.

May the best 8bitter be the winner.. if it was the CPC+.. congratulations.
I won't say it was unfair even if my C-64 ended up being the worst (what I don't expect).
One has to get used to the fact there'll always be a better one.

I'm also not too sure about that, because the GEOS-Programs could be a good challenger I suppose (I haven't worked with them yet. but I know there are drivers for a lot of actual Printers Laser/Ink,etc available).
Also Programs running under the new GEOS-Versions benefit of a lot of the new GEOS-Features (Wheels provides up to 16 MB memory together with the 20Mhz card, GEOS MP3 does Taskswitching and up to 4 MB of Memory, together with the 20Mhz card).
As I said, it is very hard to judge a Utility.

It also depends on the user's likes, because I personally hated ADVANCED ART STUDIO on the C64 and prefered AMICA PAINT very much, as some versions of AMICA PAINT have a grid inside that shows the cursor-borders, so you can map the colors according to the cards and get rid of so-called colour crashes).
Although Advanced Art Studio has a very lovely outfit.

>
> Unfair, as some machines are far better suited to good looking effects
> than others. eg, the C64 would beat the NC100 every time.

This is why this is a good chance to compare the 8 Bitters, isn't it?
It is called "competition".
What else do you want to compare than the output?
I often see people here moaning about their speccy being cooler, their C-64 being finer..
R-type on Speccy being best whileas on C-64 it should have been bull..
Games are based on GFX and playability. Playability comes with speed and precision. Both
are things that can greatly be tested in a demo-competition.
This competition is to show the machine's abilities, not the coders'.

Source record: 58814

Here's a solution (well, not really, but it works for me): acquire an old 800 machine, plug the R-Time into the right slot, the SDX cart into the left slot and the Action cart into the SDX cart. Leave the 800's opening flap in the open position and bung a Q-Tip in the lid power switch above the keyboard - hey presto! All three carts working perfectly!

PS. A 256K upgrade and a cold start button on the underside, and you'll have a fantastic Action program development machine -- I know I have...

Cheers
Jerry

From: jm@dvdmonthly.com
Message-ID: <71fhc5gjn1@boris.eden.com>
Source record: 58815

I found the following carts at a store locally. Are any rare:

They are for the 8-bit computers:

River Raid (Activision)
Buck Rogers (Sega)
E.T. (Atari) I bought this one.. seemed like I hadn't seen it
Microsoft Basic II
Beamrider
and a bunch of others I hadn't ever seen
One looked like a prototype

Anyway, if anyone knows what 800xl/800 etc. carts are rare, I would
appreciate it, as they had a lot.

:What else do you want to compare than the output?

I think the problem is in the title "best looking" which implies "best graphics"

:I often see people here moaning about their speccy being cooler, their C-64 being finer..
:R-type on Speccy being best whileas on C-64 it should have been bull..

The 64 version of R-type is shite, but not as shite as <giggle> Robocop 2. :-)

:Games are based on GFX and playability. Playability comes with speed and precision. Both
:are things that can greatly be tested in a demo-competition.

Playabilty is more than just speed and precision, otherwise all 16 and 32 bit games would have more playability than their 8 bit predecessors.

:This competition is to show the machine's abilities, not the coders'.

But how can you distinguish the two? A crap coder can make a good machine look bad. A good coder can make a bad machine look better. Unless the same coder writes for all platforms, there is no way to distinguish. Even then, it's hardly decisive.

It is a normal $50 option. It adds really
super sector copier (copies whole partitions,
1.44 disks, etc.) Improved screen dump
allowing 16 gray scales, printing in text or
graphics mode. Prints special characters, etc.
Also a Sector Editor. May not sound too
special, but the sofware is quite powerful.
Comes standard with Floppy Board, except
you can't buy a floppy board at least the last severl times I've checked. The
WOA
special had a BB with the Enhancer for $150,
which is a good deal. Ok now you know what I know about it, so if you need
more info
you have to call/email Bob Puff at CSS.

:> :>MACHINE" than giving an award for best use of hardware.
:>
:> So how would *anything* compare with say, a CPC+ or a SAM coupe? Both are
:> capable of much better graphics than the majority of 8 bit machines and
:> neither of them fall into the above 6Mhz category.
:
:Don't forget, that nice GFX are not all that makes a demo.

If the graphics aren't the key concern, then why call it "best looking"? How
about "most impressive demo on an 8 bit machine"

:Also note that good GFX often require more CPU-time.

True of the SAM, which suffers somewhat from memory hungry graphics. Not so
true of the CPC+ machines which have lot's of C64esque hardware (sprites,
split screen,...) which can actually make better, *faster* graphics than a
plain vanilla CPC.

:May the best 8bitter be the winner.. if it was the CPC+.. congratulations.
:I won't say it was unfair even if my C-64 ended up being the worst (what I
don't expect).
:One has to get used to the fact there'll always be a better one.

In a straight competition a CPC+ would wipe the floor with the other
machines, including the SAM and that is *fact*. You really only need to look
at the specs to see that. The trouble is finding a decent plus
coder/musician/artist to put together a really first class demo.

Unfortunately there aren't even that many demos already existing for it and
most of those that are can be found on my "ones that got away" list. :-(

Well, the SAM can have split mode screens (not just at horizontal
points either) .. but I agree about the memory hungry graphics.

The limit you mention is 16 bits.

An 8-bit address limit only lets you address 256 bytes of memory. That's not
enough for even a fantastically well-coded demo.

This doesn't change your point, of course.

: limit, bankswitched memory notwithstanding.

8 *BIT* address bus? Surely you're joking. We're talking 8 BIT machines
here, y'know, not 4 bit.

Of course, if you want to play with a machine with a maximum addressable
memory range of 256 bytes, go right ahead.

Subj : TAF Flea Market November 18th, 1998.

WEDSNDAY, NOVEMBER 18TH, 1998 is the date for another popular
Toronto Atari Federation FLEA MARKET! The doors open to
the Public at 7:00 PM and runs to 10:30 PM.

Yes, here's your chance to come to a bazaar of Atari-related
software and hardware where you can shop for that peripheral
or application for your ST/TT/Falcon or 8-bit that you've
been looking for. Or, if there's stuff that you have no
use for, get yourself a table and sell! Get rid of your
old stuff or find yourself a treasure!

A Half-Table costs just $5.00, Full-Table just $10.00 each.
A Half-Table is FREE to TAF MEMBERS. (Dealers are expected
to contribute a little more <grin>), with entry to the Flea
Market at $2.00 per family (Free to TAF Members).

The Flea Market itself will run from 7:00-10:30 PM (with
setup commencing after 6:00 PM and teardown at 10:30PM).
This should allow enough time for as many people inside
and outside Toronto to show up.

As usual, piracy cannot and will not be condoned at a TAF Flea
Market - anyone caught selling pirated software or stolen
hardware will be dealt with severely!

Please refer to the bottom of this document regarding getting
in touch with TAF on booking tables or finding the location
of the event - and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the
Gold Room of the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre
Library Building at 5110 Yonge Street at Parkhome Avenue.
Parking garage inside the complex next to the Novatel Hotel
Those using public transport can take the TTC's line to the
North York City Centre Station and walk through the tunnel
into the concourse, down to the food court, turn left and
find the Memorial Hall.

That's Wednsday, November 18th, 1998, 7:00-10:30 PM for the TAF FLEA
MARKET.

James,

I do not have the part number...

Just call Syquest tech support, tell them what you are doing (using it as
an internal SCSI) and ask them to send you a set of internal terminating
resistor packs for the EZ 135. They are dinky little things.

They sent them to me for free in an envelope!

Of course, opening your Syquest will void your warranty....

I did not have any problem finding the pin holes (there are two sets) for
inserting the internal resistor packs.

You must have them installed if you use the Syquest EZ 135 as the only
internal SCSI device hanging off of the Black Box.

If you don't, like I found out, your EZ135 will not be recognized by the
Black Box.

Good luck!

Geez - I forgot about GEnie. I dumped an enormous amount of money into
those (Wed nite?) Atari conferences. '88 or '89 as I remember...

Out of a cheap apartment in Florida, 600XL and a 1030 modem (Bobterm!).
I remember chatting about assorted BS with Bob Puff, the guy who wrote
Alfcrunch, the guy from Dataque (Turbo816) and about 6 or 7 others. I
also ran my LD bill into the stratosphere calling Enterprise BBS, Moose,
and some outfit in Michigan.

Ahhh, Fidonet.

Yes, the cassette buffer is often cited as a good place for a binary loader.
Personally, I like the idea of a really evil hack: Use page 1.

Page 1 is reserved by the 6502 for the stack. However, I doubt that many
programs really need more than a tiny portion of it, at least for
initialization routines. Interestingly, there is no operation to directly set
the stack pointer. That's fine--just fill it with zeros, except for one byte
set to something else. Then just pop until you get a non-zero, and you know
where you are. From that point, it's just a matter of copying in your load
routine, and hoping that any initialization subroutines don't use more than
half the stack (assuming you can get your load program in 128 bytes).

Another option is to use a fully-relocatable load routine. Then have the
routine make sure it doesn't clobber itself when loading by relocating as
necessary. Or at the very least, it could detect that it can't load the
program and display a panic message (possibly using a pre-defined display list
and display memory for that task).

I am very sad to announce that Michael Schoedel passed away, on Oct. 31, 1998, at approximatly 3:00 a.m. I just spoke to his wife Barbara on the phone. She said that Mike had been sick for the last couple of years. He and I had scheduled a chat for this morning, but when he didn't show up I thought it was a bit unusual since Mike always tried to be there.

Probably most of his online friends first met Mike back when he used to run a BBS (The Enterprise). He ran his bbs on an Atari 8-bit. Mike loved his BBS and the friends that he met there. He spoke of it often, even until recently.

I could go on and on telling you what a dear friend he truly was. He will be sadly missed. Please keep his wife Barbara in your thoughts and prayers.

His wife told me that she was having trouble getting the word out to Mike's internet friends because she never learned how to use the computer. If you know any of Mike's internet friends, please pass the word along.

Mike, you will always be near to our hearts.

Your Friend,
Tom

Hi,

I am working on the Same project my self,
putting my 130xe on a PC case,

my Atari will have a 100meg Hard Drive inside connected to the Black Box

(i thing 100meg will be enough)

Pc Keyboard interface...

Output on the Back of the Pc Case:

2x 15male pin connectors for the Joysticks...
1x 15 male connector for the atari 8 bit mouse (an St/Amiga mouse)
1x Rf connector to the TV (standard connector not the one that the Atari
have now)
2x rca connector for Video/Audio out (for regular monitor)
1x ear phone connctor for Stereo sound output (with the stereo upgrade)
1x paralell printer port (from the Black box or ICD adapter)
1x serial out put for External modem (i might install an internal modem)

1x 15 pin mail connector that will replace the ATARI sio connector.
1x vga out put to connect a stantard vga Monitor to the atari (i am
still working on this vga project)

My 130xe computer have 1 meg of memory but it takes the antic banks..
and 3 os's installed that are controlled my a 3 possition swtich...

Let me know how your project goes...

Regards,

Nir Dary

How about including an 8bit address bus limit, which I feel is the real
deciding factor that the system is actually 8bit. This includes the mainstream
65xx, Z80 and 68xx processors. IMHO, a processor isn't 8bit without that FFFF
limit, bankswitched memory notwithstanding.

Sorry if this seems a stupid question but I don't have my mapping the atari
anymore. (I wish someone would put it on the web!)
I am writing a little binary loader to load big files. I remember vaguely
in the past that I used the cassette buffer, that way you could load huge
binary files that took up nearly the whole memory (on 800XL). However
I can't remember where the cassette buffer is in memory and how much
space is there! Can someone point me in the right direction? or perhaps
suggest a better location? Hopefully 128 bytes ought to do it.
e-mail replies welcome.

:In article <716nk7$rn8@cpca3.uea.ac.uk>, a.p.cadley@uea.ac.uk says...
:>
:> Brix wrote in message ...

:Yes, but do you want someone to compete with a 20Mhz clocked 8-bit machine
(if there was
:one).

Not if it's some bolt on SCPU alike. Are you suggesting it would be fair to compare a 6Mhz 6502 machine (if such a beast exists) with a 6Mhz Z80 machine?

The PCW16 is about 16Mhz, but it's a sodding word processor. It's not exactly going to be easy to create a stunning demo on it, is it?

:This is just to eliminate too fast machines. Most stock units are in this
area anyway (3,5
:Mhz spectrum, 2 Mhz C128, 1 Mhz C-64)
:Note, I'm talking about stock units. Others are not allowed.

Yes, but there *are* stock Z80 machines that reach, or go above the 6Mhz limit. I don't see why they should be excluded. If, as you say, we stick to stock machines then it won't really be a problem limiting speed anyway. There aren't any mega high speed 8 bits that I know of.

:NES has no floppy-drive, nor has an ATARI 2600. We make exceptions of the
rules when the
:machines have nothing but a cartridge port, also when the machine needs a
cartridge to
:work (like the mentioned CPC+ or TI66)

Okay. In the case of machines like the CPC+ (again) which *has* got a disc drive/tape deck, do you *have* to stick to the BASIC cartridge, or could you write your demo for a cartridge instead? Believe me, it can make a *big* difference, because the advanced hardware is wired up to suit cartridge games better.

If not, what about if you stick to 64K ram and no keyboard, making it compatible with the GX4000 console?

I just fancy writing a GX demo really...

:Other ways would be excluding all competing scenes from voting and letting
the PC
:community decide or letting the whole Partypeople vote (of course still no

selfvoting
:allowed).

It's a toughy. Imagine for example if their were 50 Speccy owners and 49 C64 owners and no-one else. The C64 would *have* to win. Okay, I'll admit, it's a slightly contrived example, but you could conceivably end up with something similar.

:I think to show the best of all is the best solution. So we get a clear impression what is
:possible, and not what os possible in time. Let the best compete with the best. No
:deadline.

Does the C64 come under a different category to the C128? What about the CPC and Plus machines? Or the Speccy and SAM? (tricky one that)

The problem being that SAM demos would obviously get entered over and above Speccy ones, 'cos there bound to be a bit fancier. There is also the small problem of finding demos for the more obscure machines. There are only about 3 demos which are CPC+ "enhanced", less which are dedicated solely to it and most of them are on my "ones that got away" list. :-(

:Here is the reason why all should be on Video. A SCART-Plug always gives a fair picture. I
:doubt there will be any 8-bit machine that needs more than this.
:Btw: On a videobeamer every picture (even from PCs) is a bit blury as the limit goes
:for all machines it isn't such a problem...

I see your point. The problem I was trying to highlight is that not all machines output a TV signal. The CPC won't without extra hardware and even then the quality of hi-res MODE 2 images aren't going to be very good if someone decides to use them.

:The competition will be held on a usual convention. So no need to upload it anywhere.

Are there any conventions which are easy for *everyone* to get to. Somehow, I don't think so, which is why I'd prefer a net based competition. There are emulators for most machines capable of the majority of hardware tricks. I reckon that would be easier for most people.

:> What the hell is a Videobeamer anyway?
:
:A machine that throws the picture, seen on the monitor or TV-screen to a Wall. Cinema-
:size. So the whole voting Public in the competition room can see it.

Hmmm. I think you'll find it a tad hard to connect one to a CPC though, given the lack of TV out.

:[TP8]
:Yes it is a 3-days convention held around christmas in Denmark.

Egad! I'm a poor student, m'lud. I can barely afford a day trip to London, let alone three days in Denmark. Oi'll be scrimping me pocket's just to 'ford a cu'ple o' prezzies this year.

Ahem.

I can't afford that option. :-(

:[videotapes]
:On those conventions there were always problems with connecting all the different machines
:(Pc,Acorn,C-64,Amiga) to the Videobeamer, because of different plugs and signals. So now
:the standard for all non-PC's is to record the Demos on VHS a short time before the
:competition.

I see. Still seems a bit of a contrived way of doing things though.

:This is done by the Organizers of the Party together with a guy who has the knowledge and
:who brings the machine to play the demo.

Finding someone with both knowledge, a CPC+ and the money to travel to Denmark might be a shade tricky though. The machine isn't exactly rare, but they aren't found on every market stall either.

The monitors are also *bloody* cumbersome things at the best of times.

Ahh, that is a 16-bit address bus. An 8-bit address bus would yield
merely 256 bytes of addressable memory.

The Z80 has a 16-bit address bus. How else could you have a 16 bit
address like 0xFFFF?

> IMHO, a processor isn't 8bit without that FFFF
>limit, bankswitched memory notwithstanding.

Please consult the nearest primary school for some counting lessons.

>But seriously, some Tandy PCs had an 80286 CPU and an 8-bit bus.

I find that somewhat difficult to believe, as the 80286 had 16 data
pins on the chip. What did the CPU in this Tandy machine do when it
came across 16-bit memory access instructions like MOV AX,[whatever] ?

> e-mail replies welcome.

If its very small, try hiding it at the bottom of the stack, around $110.

I say $110 because some chain loaders (pirate logos, etc) also used this
trick to store data from $100-$110.

Thats my default address for the ApeLoader binary loader and it works great
for 95% of the bin files out there. If your loader is over 114 bytes
you probably will run into trouble though.

The ApeLoader is 110 bytes long, but it has the ability to let APE do most
of the work, so it can be quite small.

Other popular places are $3DF (cassette buffer), and $600. You will have
more room there but your chances of surviving are far lower.

Guys!

Architecture of any processor is specified by it's data bus and/or
internal registers capacity. For example 8088 is 16 bit processor with 8
bit data bus and 8086 is the same processor, but with 16 bit data bus.
The difference is in overall speed. Anyway If a processor has 16 data
bus it HAVE TO has 16 bit data registers, so register's capacity should
be used as a clue.
I am not going to start in this competition, but I'm little bit curious
of it.

Greets,

Alex

>
> Aaron

Aaron,
The sound quality of the ASP wasn't very good, especially compared to
todays audio recording systems. The included samples should have been
better than you posted. Mine sounded reasonable.
The hardware should produce the same quality as the included samples.
Check that re variable resistors are set properly. You may also have a
bad paddle port on the computer. To test this, plus in a paddle and
enter/run the following program:

```
10 pos.2,0:?"P0","P1","P2","P3"
20 POS.2,1:? peek(624),peek(625),peek(626),peek(627)
30 goto 10
40 rem read paddle (0), paddle (1), paddle (2), paddle (3)

run
```

This will display a constant stream of numbers (about 0 through about
228) depending on the value set by the paddle (pot). Optimum would be 0
to 228. The upper value varies a bit. if you don't get continuous values
as you turn the pot (slowly), the capacitors in the computer may be bad.
If you just bump the knob enough to maky a slight change and you either
get no value change or a huge jump, either the pot is bad or the
capacitors may be bad.
This should also work the same way for the ASP interface. The volume of
the sound should make the values change in the same value range as pot.
The above program should work fine for this. If you get 0 even with a
reasonable amount of volume, adjust the threshold pot to a lower value
until the numbers are in a reasonable range for the volume level.

Distortion can be controlled a bit with the input level pot (upper value).

Hope this helps.

Hmm. You bought the most common one of the bunch :) Most are uncommon. They usually go for 5 to 10 online. Some thorn/EMI carts like jumbo jet pilot are rare. All activision carts are great to play. I still play megamania in my 400 all the time. Some carts like demon attack don't work on the xl/xe systems. As for proto's. It is easy to get socketed cart boards and cases so it wouldn't suprise me.

Greetings Programs.
Anybody know where I can find the muppet learning keyboard for the atari computer. I ran across one this weekend at a flea market that had a DB9 male and I don't know what computer it was for.
Speaking of muppets, anybody know how to play big birds funhouse? I got the cart for a buck but am cluless on how to play. My daughtre thinks its funny to see me just pushing keys :)
Thanks
Mark

Does anyone know how to contact the owners of the OmnimonXL rom, XLfix rom and the Hires rom.

If the owners are still around I'm hoping they will allow the use of the rom images with the emulators like Atari800win and the other ports. Although I'm *not* connected with the emulator team I am a keen user of Atari800win and already own (and have from day one) a real OmnimonXL that's fitted into my multi Os 130XE.

Omnimon seems to work bar Jump and trace crashes (not always but mostly) + the way to enter the Omnimon is to do a warm start with the SELECT key held down, at the mo the Warmstart is knacked on the win version but will be fixed in a future release, a COLDSTART with SELECT does work but mem is cleared totally. The Xlfix rom seems AOK..Don't know how to test the Hires rom. :(

Sure I could just say, here fella's have the roms but I thought I would ask first..

(hires rom?, omnimon and some other rom.)
I know the omnimon was Newell, I think (hows that for wishy washy).
FTe bought Newell and I believe now owns the rights to Omnimon.
Which gets you noplace, since everyone knows (ask your grandmom)
that FTe belongs to Mike Hohman and he has disappeared.

(the muppet keyboard is for either C=64 or A8, I think, you
need the driver disk for it to work).
Big Bird's Funhouse.
?=Play
RETURN=start play
.=select
b=pink thing
d=oscar
k=cookie monster
space=ok, now hide
q=bert
y=ernie
4=THE COUNT
return also = pop up for games 4&5
up arrow=snufflufagus
9=grover
They hide when you push space and then you have to hit the
key for where they were when the game started.

It's a credit to you that you even bother asking. That's rare. The topic comes up a lot, but I can't remember the last time someone tried to research a copyright holder. Actually, if I didn't know the copyright status of the roms I distribute, I might be a tiny bit uncomfortable...

As Russ wrote, the rights to the Newell products like OmniMon are owned by Fine Tooned Engineering aka Mike Hohman, who "no one" knows how to reach.

Is XL-Fix the 400/800 translator for the XL/XE computers? I think I have it. Isn't it in the public domain?

What's Hires?

Rambrandt is a drawing program also from Antic Catalog. It was written in
Forth,
had its own file system (had to use utility to transfer pictures to dos),
and somewhat
buggy. It could do some neat things though like rotating blocks by small
degree
increments, DLI color changes, and some pretty powerful userdefineable
brushes,
tiles, patterns. Solid Object Module was an add on program that could
create
various 3d objects. I both on disk somewhere I bought from them years ago.

In that case I am stuffed a tad :)

I might as well put these roms up on the binaries site for people to try..REMEMBER TO DELETE THEM AFTER 24HRS FOLKS!!!

Unless there are massive objections I will do this tomorrow night at 6pm GMT.

And for those that cannot get that group and want to try them, well they can mail me for them...

Have fun with them....If anyone ever does make contact with this Mike Hohman (I have a feeling he did a few people out of cash??) then after you ring his neck ask him my question :)

Thanks Russ...

3721. Problems with CD-ROM

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-03 00:00:00 UTC
From: belthasar@scbbs.bungi.com.nospam
Message-ID: <910065757.1@scbbs.bungi.com.NOSPAM>
Source record: 58739

I am trying to connect an IBM Eternal Enhanced CD II to a Supra Hard disk
controller (with a 49MB Seagate 157N SCSI drive with termination inside the
case). The CD-ROM is connected to the 25-pin connector on the back of the
Supra (the 25-pin connector goes onto a 25-pin header on the controller).
This goes into one of the 50-pin connectors on the back of the CD drive, the
other 50-pin has a SCSI terminator. The HD is ID0, the CD is ID1. I am
trying to use MetaDOS 2.7.

MetaDOS installs, but says illegal disk change whenever I goto use it. The
ISO9660 driver also reports DEVICE NOT RESPONDING.

OK, the CD needs parity or something, installed a Wangtek 5525ES tape drive in
the case as ID2. Installed tape software, and the tape software couldn't find
the tape drive....However, when I turned the Supra on with a tape in the
drive, the drive initalized meaning it is seeing the controller.

My question is, can I use the devices like this or do I have to get a

50-centronics/50-header/50-centronics cable for the controller board and
connect everything that way?

Help me please!

Also, does anyone have a copy of the Supradrive Utilities disk that they could
zip up into a file and e-mail attach to me? My disk went bad and the boot
sector on the harddisk went corrupt trying to install the CIHD(?) driver.

(Paul talks about Omnimon rom.)
Right.
But, Paul.
I don't understand what good an Omnimon dump will do anyone?
It (Omnimon) is interesting and useful for dumping carts.
That's all I ever used it for.
The thing is, it is good to have an archive of the romdump,
someone could burn an OS (I dunno if A8 os is eprom, or
what type, or how to use an eprom burner, etc.)
BUT (I like a big but), what can anyone do with it?
You put it in OS area RAM and it will stay there until
you go to use it. Seems like there was a keystroke combo
to get into it, but I always hit RESET SELECT to enter it.
And who's gonna hack a cart ROM from an emulator?
I guess I just don't get it.
Russ

The disk version source code is long gone. I never kept incremental updates at that point, and the cartridge version would be pretty much useless? I'm not sure why anyone would want it...we've got messages saying it wasn't very good and messages saying that someone was 'unfortunate enough to have the product' and this hurts my feelings tee hee. I don't get it. If there's some real reason that this would be useful I might consider it.

By the way...the 80-column thing was probably when we were talking 80 column mode in Diamond Write which was essentially a 4 x 8 font which looked horrible so we went with a 5 x 8 font which offered 320 / 5 or 64 columns minus the window edges. Unfortunately it wasn't too far after that that ICD pulled the plug on Diamond GOS and stopped making the cartridges we needed and we really didn't get the developer support that Diamond needed to survive. I'm not saying that like it was anyone's fault or the Atari community was unsupportive (although Atari most definitely was a lot of hot air) as it's been interesting to see how much money/push Microsoft needed back in the late 80's/early 90's to get Windows to be where it is today. I think the final production count of Diamond carts was around 1,000 units (I have no idea of the exact number).

I'll be happy to provide the final 3.0 ROM image for those that want to burn new ROMs for their older version cartridges. It's just a 27512 PROM or EPROM in there if anyone wants it.

I believe the FIX-XL rom is just a burn of the disk based one that was
public domain. At least I dont remember seeing any copyright info last
time I loaded the FIX-XL disk. Anyone know for sure?

Ahh ... so it had a weird memory controller; but the bus between the
processor and the memory controller was still 16-bit ;-)

Hello,

I think I can help you, as I run the Portfolio Club in the U.K. We have over 80 hardware and 600 software items in stock, we also buy and repair Portfolio's. If you would like a copy of my clubs latest eight page price list as well as details about the club, please send a S.A.E (Stamped Addressed Envelope) A5 size (approx 160mm * 230mm) or larger to:

Portfolio Club (U.K)
16 Cedars Road
MORDEN
Surrey
SM4 5AB
U.K, England

Or leave a message on our clubs answermachine, or send a fax:
Telephone & Fax(Home) +44 (0)181-286-8990

E-mail:paulfinch@x-stream.co.uk

Hope the above helps!

Paul

We MUST keep the Atari Portfolio Alive!

P.S. Visit our clubs stand at the AMP 98 Computer & Electronics Show (including the Atari Show) on 14th November, 1998 at Bingley Hall, Staffordshire Showground, Weston Road, Stafford, England. Between 10-4, only costs £3.00p admission. Lots of bargains to be found!

>so.

Well, actually I'm using a PC from the computer room at the university.
Because it's easier and my responses are posted sooner than when I have to do
it via a BBS (I do that too). But I only use it as much (or as little) as
possible. It takes ages before I figure out how even the simplest of things
work on these crummy things. Atleast on an 8 bit Atari you know what can
happen/what to expect. Ever tried to change the config. on these things? Why
can't this silly answering window stay the size I want to?

I don't know if I am allowed to install anything on these things.

>
> - Alan

I bought the cartridge from Shelly (Shelton) Merrill. First he tried to tell me I didn't pay, then he sent me the cartridge (plus paint, which I didn't order) plus a rubber check for approx. 100 US Dollars.

That and the fact that I love MyDOS, and that I didn't have a mouse (the rest was too slow if I remember correctly) made me only try Diamond GOS a couple of times before I shelved it.

If you want to, please send me the 3.0 ROM image.

I had it back in 86 originally. It plugged into joystick port 1. The one I saw this weekend had a male plug on the end. This wouldn't fit either the C64 or A8. A TI maybe?

Thanks for the funhouse info. I wonder if I can make an overlay for my 400 with little sesame street characters on it :)

I know and I can't wait to see it. :) Although given that my plus is dead
and it probably won't run on an emulator (truly fantastic demos never do, at
least not properly), that might be a long time. I'll probably have to drag
my sorry little arse to a convention or something.

Pity it's only a single part though. A full blown plus only megademo would
be *so* cool. You could have some proper interlaced bits, some cool dynamic
spotlight effects and all manner of scrolly stuff. And then you could start
writing some difficult code as well. :-)

Date: 1998-11-03 00:00:00 UTC
From: Michael Chandler <mchandle@earthlink999.net>
Message-ID: <ZmG%1.7$I4.299084@newsfeed.avtel.net>
Source record: 58760

Greetings,

A good 90% of all my old 800XL disk copies are warped or unusable. Would someone be so kind as to forward some copies of disks to me? I'm looking for the following:

Bruce Lee
Blue Max
Gyruss
Gyruss 2
Galaga
Ball Blaster
Star Wars
Hitchhikers Guide to the Galaxy
Pong (8 bit)
Archon
Archon 2
Pole Position
Q-bert
Qix

At the very least, I need Bruce Lee and Archon! If anyone can help me with this I would be forever in your debt. I'd be happy to pay any shipping costs, etc. If you can help, please reply to mchandle@earthlink999.net without the 999 (no spam). Also, if you have a bunch of Atari 800 disk copies that you're thinking of throwing away, send them to me first! My poor games are warped <tear>.

Thanks,

Mike

3743. Roms uploaded.

Since there were no (so far) complaints about the upload of the 3 roms I have since put them on the binaries group, this was done at 6pm GMT.

If you don't get that group then send me a mail re them.

I have had no response from any of the authors (known one(s)) and suspect 2 of the roms might be PD anyway. The roms are OmnimonXL, XL-fix and a Highres rom..

Remember, these are NOT carts but OS replacements that can be used on the emulators instead of the atarixl.rom.

>you go to use it. Seems like there was a keystroke combo
>to get into it, but I always hit RESET SELECT to enter it.
>And who's gonna hack a cart ROM from an emulator?
>I guess I just don't get it.

I used mine (real) for ripping screens, fonts, etc etc and I have to say
hacking in general. A certain Raid over Libya aka Sidewinder was
possible because of the Omnimon even tho the programmer said it was
protected against it. (it wasn't)

The rom now just replaces the atarixl.rom as the op sys and it seems ok

3746. 815 Parts For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-03 00:00:00 UTC
From: Christopher Strong <strong@eng.utah.edu>
Message-ID: <363F5928.66B8320B@eng.utah.edu>
Source record: 58764

I have some Atari 815 (Dual Disk Drive) Side Boards I am considering offering for sale.

There are three spare boards in my collection; one is complete (100% populated), others are missing ROMs and some controller chips. I may be able to provide copies of the EPROMS if someone is interested, but I assume most purchasers would be collectors.

If anyone is interested in purchasing these boards or my holding an on-line auction, please let me know.

These are almost certainly the last virgin 815 boards in existence, and came out of Atari Engineering when Tramiel took over.

Source record: 58766

Hi,

The millenium bug is found also in the TDLINE from spartados. When loading
and using a R-time 8 you will see that the original ICD TDLINE will say at
1-1-2000 that it is friday and 31-12-99 is also friday!
The FTE TDLINE version is patched and will cause problems in 2083 but I
think I don't live that long...

So when you are really a R-time 8 user (SYSOP) running BBS pro then try to
get this new TDLINE.
You can find it together with 3.2g(x) package....

> What else do you want to compare than the output?
> I often see people here moaning about their speccy being cooler, their C-64 being finer..
> R-type on Speccy being best whileas on C-64 it should have been bull..

Yes!, and how a game plays/look has some to do with the hardware, but
most often it is the coders (in-)ability to master the hardware that
really makes the difference. Having said that, it is true that some
hardware makes it a lot easier to make a desent game even for half bad
coder. I think it's the difference between the c64 and the speccy, the
c64 got sprite/hardware scroll which is pretty easy to make something
run fast and looking good one, but gameplay migth be crap
nevertheless... on speccy a bad coder would make it all look bad...

> Games are based on GFX and playability. Playability comes with speed and precision. Both
> are things that can greatly be tested in a demo-competition.

Yes, but again gameplay can't. I have made a 'few' demos for the CPC's
(some freakz have even said they were good...)
but the game's I tried to write were not at all good, so does it make
the CPC lame for games ??? or just make me a bad game coder??? (I think
the true is somewere in the middle ;->)

> This competition is to show the machine's abilities, not the coders'.

This must be a joke!!, you can't distinguish the two!
A lame coder can make even the best Nintendo 64 hardware look like crap,
compared to a cool coded ZX81 demo! (Just to make a point)

Unfortunately I haven't see the tread from the start so I don't know
what the idea with the competition was, but I think a
demo competition between coders on each machine could be cool, or as
secondary goal, a competion between coders on different machines. But in
the last case, the judgment should ofcourse be best use of specific
hardware, making it best 'looks' nomatter what (8bit-) hardware would be
unfair to older machines. (In the case of a 'best looks' compo. I think
the old Enterprise system would have a great chance of winning, if one
could find a good coder for it, as it as I remember it, got some cool
hardware for sprites/hardware windows)

Yes, indeed. Amiga CD32 was a cute concole too that would have wiped the floor with SNES and MegadriveII, but there was no cool software for it. Sad but true. That was Commodore's death.

> graphics"

Wasn't meant to be like that, a good look (for me) is also smooth vectors, rad effects , like wormholes, good sound...

As you said in a follow-up before "Most impressive" would be the closer description.

> :Games are based on GFX and playability. Playability comes with speed and
> precision. Both
> :are things that can greatly be tested in a demo-competition.
>
> Playabilty is more than just speed and precision, otherwise all 16 and 32
> bit games would have more playability than their 8 bit predecessors.

Haha, ok, it highly depends on the software too, but what i was about to say is that a very slow machine that gives you "ELITE" with 1 frame per second can't output a playable "Elite" game.
Of course a stupid program can't give good playability.. i mean.. a PC screensaver doesn't even scroll smoothly with a Pentium II processor at 300Mhz, while a C64 makes Fullscreen scrolls at 0.98 Mhz. Haha.

> :This competition is to show the machine's abilities, not the coders'.

> look bad. A good coder can make a bad machine look better. Unless the same
> coder writes for all platforms, there is no way to distinguish. Even then,
> it's hardly decisive.

Yes, very true. That is why I suggested that each scene picks their contestants, so we can at least compare the best available codes to each other. We can be pretty sure that among thousands of coders for each system, the best ones will be about equally good.
At least this applies to Speccy, CPC, Atari and C64, where we had enough coders.

> compare a 6Mhz 6502 machine (if such a beast exists) with a 6Mhz Z80
> machine?

What I'm, suggesting is to give limits so no Supernatural Hardware can enter.
Of course The Speccy had about 3 Mhz and the C-64 had 0.98, but I'm talking about stock machines only, so you won't have to compete with a 3Mhz C-64.

> The PCW16 is about 16Mhz, but it's a sodding word processor. It's not
> exactly going to be easy to create a stunning demo on it, is it?

If there was a good coder, he could even sweep some machines with stunning 3-d effects, even if he only had 2 colors (Dithered Gouraud shading, etc) or greyscales.
But as I think 16Mhz would bee too much processor power to be comparable to the other machines, the PCW16 would be out of competition.

> :This is just to eliminate too fast machines. Most stock units are in this

> stock machines then it won't really be a problem limiting speed anyway.
> There aren't any mega high speed 8 bits that I know of.

Well, if there was no problem, then I'd say let's keep that limits.
Why exclude them? I think we should limit the competition to "comparable" machines only.
If you look at 32 Bit systems, you get problems when you want to set up a democompetition, because the Acorn A3010 and the PentiumII/300 are too far apart, when you look at the clockspeeds, and clockspeed is a part of performance too.
The limit is just to exclude too fast machines, so we get a rather fair competition.

> write your demo for a cartridge instead? Believe me, it can make a *big*
> difference, because the advanced hardware is wired up to suit cartridge
> games better.

If the machine would NOT run without a cartridge, it is allowed.
If the machine runs without a cartridge, the demo has to be coded for use without any add on.
Example: I could write a Demo that uses a C-64's Ram Expansion Unit's DMA to blitter Animated Hires fullscreen Graphics on the C-64 screens and make 'em go crazy, but as the C-64 does not need this Ram Expansion Unit it is not allowed.
Generally Demos on Cartridges are only allowed, if the machine cannot load Demos from Disc/Tape.
So a CPC 464/664/6128, Atari 800xl/320xe, Commodore 64/128 and Spectrum HAVE to run the Demo from Disc/Tape, and the demos MUST NOT use Hardware Expansion units, like a Ram Expansion, Hardware-Basic Expansion, SCPU-Turbocard, Stereo/quattro Soundchip-add ons, etc.
A C-116 plus4, may also NOT use the Synergy SID Card.
A NES has no Discdrive/Tapedrive available, so the Demo may be run from Cartridge.
In case of a CPC664 the demo must be run from a 3" disc drive, C64 must come from Tape or the standard 5-1/4" drive (1541,1541-II), no SFD or FD Floppies or HD's allowed.

> If not, what about if you stick to 64K ram and no keyboard, making it
> compatible with the GX4000 console?

Sticking to 64K ram would disqualify the C128 and the CPC6128 which still can be compared to a C-64 or CPC664 or Atari 800xl, so the 64K Ram limit would be unfair.
The machine may have a Keyboard, but does not have to in my opinion, because a NO KEYBOARD-rule would disqualify the NES,the C64gs and the Atari 2600.

> I just fancy writing a GX demo really...

Then do it :) if the GX is below 6 Mhz, has an 8 bit proz. it is just fair to compare it with the others isn't it?

> :Other ways would be excluding all competing scenes from voting and letting
> the PC

> owners and no-one else. The C64 would *have* to win. Okay, I'll admit, it's
> a slightly contrived example, but you could conceivably end up with
> something similar.

Huh, so how do you think we should make the voting?
We have to disqualify selfvoting in some way, so no BIG C64 scene e.g. could selvote itself to the top.
My suggestion is, that selfvoting is forbidden, and ALL Scenes are voting. Since this Competition will be held on a big Computer Event with mostly PC People there, it will be fair enough in my opinion.
I'm, still thinking about the rules, so maybe I can organize something like an 8 bit

democompo on one of the forthcoming events like Mekka Symposium or Siliconvention.

> :I think to show the best of all is the best solution. So we get a clear
> impression what is
> :possible, and not what os possible in time. Let the best compete with the
> best. No
> :deadline.
>
> Does the C64 come under a different category to the C128? What about the CPC
> and Plus machines? Or the Speccy and SAM? (tricky one that)

No categories. Just one competition.

Another way of voting would be to show all the demos mixed, without telling the system it belongs to, and let the whole partypeople decide which demo is the best. For that we could even allow selfvoting, as the PC-Scene is voting too and selfvoters will get less important then. Since most PC people do not always know which demo comes from which system (they may guess, but they can't be always sure).
The result now tells you, which Scene had the most points (like a constructor's championship in formula 1) and which scene produced the best demo (in the opinion of the voters).

For 15 Demos, the first demo will get 15 points, the 15th demo gets 1 point.
This however requires, that each scene gives exactly 5 Demos to the competition, when there are 3 scenes.. if a scene cannot provide such an amount of demos it is rather bad for it, but the major scenes will be able to chose 5 demos, will they?

> The problem being that SAM demos would obviously get entered over and above
> Speccy ones, 'cos there bound to be a bit fancier. There is also the small
> problem of finding demos for the more obscure machines. There are only about
> 3 demos which are CPC+ "enhanced", less which are dedicated solely to it and
> most of them are on my "ones that got away" list. :-(

the same applies to the C128, where I know NO demo (I think there exist a few, but I haven't seen one yet).. Although I am a Commodore-lover, I would say: Bad luck.

> :Here is the reason why all should be on Video. A SCART-Plug always gives a

> machines output a TV signal. The CPC won't without extra hardware and even
> then the quality of hi-res MODE 2 images aren't going to be very good if
> someone decides to use them.

Well, it is surely possible to get a composite signal (like Choma/Luma or linear RGB) from the CPC's port, isn't it? Both can be conected to a Videorecorder's SCART cable and thus provide a picture that is good enough. C64's Hires will be somewhat worse than on a monitor too, but as this is a problem for all machines it isn't unfair.

> :The competition will be held on a usual convention. So no need to upload it
> anywhere.
>
> Are there any conventions which are easy for *everyone* to get to. Somehow,
> I don't think so, which is why I'd prefer a net based competition. There are
> emulators for most machines capable of the majority of hardware tricks. I
> reckon that would be easier for most people.

How do you want to vote on the net? I mean I could use a mailbomber to send you
100,000,000 votes for the C-64 scene under different names.
How can I watch the demo, when I have no CPC here and my Computer is too slow for an
Emulator? When I cannot afford to download 100,000 MB of Mpeg?
I think such a party with about 2000-4000 People is representive enough.
Believe me, the whole C-64 scene also cannot be on a big party, but the result is somewhat
fair anyway. I don't know how often you have been on such events, but I can tell you from
my experience that this is a very common way to do competitions on the C-64 and this way
is accepted as being fair by the whole C-64 community.

> :> What the hell is a Videobeamer anyway?
> :
> :A machine that throws the picture, seen on the monitor or TV-screen to a
> Wall. Cinema-
> :size. So the whole voting Public in the competition room can see it.
>
> Hmmm. I think you'll find it a tad hard to connect one to a CPC though,
> given the lack of TV out.

Linear RGB, Crominance/Luminance? Some signal like that?
Then it'll be no problem.
Then you just need the specs for the CPC's plug and a SCART-Plug to built an adaptor.

> :[TP8]
> :Yes it is a 3-days convention held around christmas in Denmark.
>
> Egad! I'm a poor student, m'lud. I can barely afford a day trip to London,
> let alone three days in Denmark. Oi'll be scrimping me pocket's just to
> 'ford a cu'ple o' prezzies this year.

I can't also be there, but I'm a hell of interested which C-64 releases there will be..
and if there is something released I can quickly suck it from an FTP Site.
I also don't worry that the votes will be unfair.
Just the way it is.
Who sais that only the 8Bit scenes may vote? Let the PC people vote too, and you get an
even fairer result with less patriotism.

> :This is done by the Organizers of the Party together with a guy who has the
> knowledge and
> :who brings the machine to play the demo.
>
> Finding someone with both knowledge, a CPC+ and the money to travel to
> Denmark might be a shade tricky though. The machine isn't exactly rare, but
> they aren't found on every market stall either.

Well, if we say that only the real important machines take part (the unimportant ones are rather unlikely able to collect enough demos) then it'll be no problem.
I will for sure find someone who has a CPC 664/6128 or an Atari 800xl to play a demo.
The only problem left would be the adaptors for a SCART-Signal and that this guy gets the best demos to record them on VHS.
We even managed to do an ACORN-Democompetition, even though their monitors are another world (that beast has so damned many screenmodes, that it is uncountable - so the monitors are quite scary too).

I have a best electronics Quadrun and Submarine commander proto for trade.
They are in plain black atari cases with a little label that says what game
they are.

I originally thought they were atari lab loaners, but found out they
were only best electronics protos (under a fake lab loaner label). Still
these are quite rare, and I want to trade them (too many bad memories). I am
looking for any ER game not on my 2600 list (especially any by Atari)

my list can be accessed at:

http://pilot.msu.edu/user/reicher6/atari.htm

or failing that, try

http://pilot.msu.edu/user/reicher6/2600.txt

I am not quite sure of the R-Time itself, but I just tested it under
SpartaDOS X ver. 4.20 and it failed. I set the date to the 31st of
DEC 99 a minute before midnight and watched. DEC 31, 1999 is a
Friday. The date flipped over to 1-JAN-00 and it STILL said Friday.
This leads me to a couple of conclusions.

1) The R-Time 8 is not aware of days of week, days in months (leap
years etc) for the next century (millenium even).

2) Either SDX 4.20, the RT8 or BOTH are incapable of a 4 digit year.

Perhaps Jan 1 1900 was a Friday?

I see that this newsgroup doesn't support binaries...if there's a
single place out there that I can post the Diamond GOS ROM to so all
can get it I'd be happy to contribute it to an archive. I don't really
have the time to email a copy here and a copy there. I'll be happy to
divulge the bank switching method and how the mouse worked too if
anyone wants to add support to an emulator for it.

Hi Alan-
I don't believe the file made it through.
You might try alt.binaries.comp.atari8bit
Thanks for your generous gift of the upgrade. I don't know what version I have, but I'll check.
Regards,
Larry

Ok it's: alt.binaries.comp.atari8bit

3770. FA: Autoduel CIB, Caverns of Callisto, others

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-04 00:00:00 UTC
From: mgfrank@my-dejanews.com
Message-ID: <71oqvfmkt1@nnrp1.dejanews.com>
Source record: 58641

I've put some Atari 8-bit games up for auction on eBay:

Autoduel (Origin) complete in box
Caverns of Callisto (Origin) boxed, probably complete
Caverns of Mars (Atari) old-style box
MIG Alley Ace (MicroProse) boxed
Necromancer (Atari rerelease of Synapse game) cart with docs
Spider City (Sirius) loose cart
Editor Assembler (Atari) loose cart
Congo Bongo (Sega) loose cart

You can see these auctions at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&user
id= mgfrank&include=0&since=-1&sort=2&rows=25

With luck DejaNews didn't wordwrap that url. :-) If that one's irritating to
cut and paste go to http://cayman.ebay2.com/aw/search.html and do a seller
search for "mgfrank".

International buyers welcome.

Thanks for your interest!

There were some demo coders. There was a massive following in Hungary.
I have seen a screen shot from a Enterprise demo, it looked very
impressive. I think this demo also had sampled music.
Unfortunatly, we will have to wait for a good emulator to arrive to
see these demos, because the number of Enterprise computers to be
found is very small.

:>split screen,...) which can actually make better, *faster* graphics than a
:>plain vanilla CPC.
:
:Well, the SAM can have split mode screens (not just at horizontal
:points either) .. but I agree about the memory hungry graphics.

By split screen I ment the ability to have the display split into two
"screens". Each of which can be hardware scrolled independently of the
other. It's true that the CPC can't change mode in the middle of a line[1]
but I never really saw much use for that anyway. :-)

:>In a straight competition a CPC+ would wipe the floor with the other
:>machines, including the SAM and that is *fact*. You really only need to
look
:>at the specs to see that. The trouble is finding a decent plus
:>coder/musician/artist to put together a really first class demo.
:
:Err.... it'd be close between the two machines. But, like so many
:machines, they both have their good points...

I honestly don't think so. The speed gain on the SAM is about 50% and yet
you have twice as much video memory to deal with. Worse still, if you change
mode to a less memory hungry one then you get more contention to make it run
like a speccy.

It *might* gain an edge with 3D stuff but I couldn't say for sure. For
anything else I think you'd be struggling.

>Rgds,
>Vinnie

That depends on how the RTime 8 uses the pins. The right slot has NO s5 and rd5. It does have s4 and rd4, but on those pins where s5 and rd5 are on the left slot. Pin 1 is RW-LATE, which the left slot does not have (I don't know yet what this RW-Late is) and Pin A has the system clock, pin B has GND. The rest is the same.

BTW I'm not quite sure about the "name" rd4/5. It's "r" something, followed by the number.

I don't know what happens if the Rtime uses these pins.

>

Yes, there was. I only had the chance to play the thing *once* in some billard cafe. Being quite the spelunker fan (I had played it through several times on the C64) I inserted my coin. Well - the damn machine didn't work right, I told the operator I just had lost a coin in there and the next time I went there the machine was gone *sigh*. The gameplay was somewhat different, the whole graphic blocks being bigger, etc. Still, the game looked pretty good to me, and the first level still was named 'The Elevator'. I never have seen ROM images for the arcade machine anywhere on the net, unfortunately, else I probably would have tried to emulate the thing myself :)

How does Diamond OS compare to MyDOS or any of the others? Is it true that it is a GUI (sorry, I don't know much about it and it isn't on any of the FAQs that I could find?)

Also, are all DOS versions available as .bin files for free, or do they have to be ordered?

Lintilla,
With reasonable certainty, I'd say JTS now is the owner. JST, a disk
drive company, owns the rights to all Atari 8-bit and ST hardware and
firmware and, I believe the, Atari name. The game software, I believe
now belongs to Hasbro.

Ok...the GOS 3.0 ROM is in the binaries newsgroup and the file is called DIAMOND2.ROM so don't think it's the 2.0 ROM. That's the just name on my Atari archive CD-R.

Also, keep in mind that you need the original Diamond GOS super cart with its PLA chip to use this image. It will do you no good with a standard cartridge.

And for those that don't know what Diamond is...it's a programmable GUI environment created around 1988 for the Atari 8-bits that offering moveable windows, mouse support, and all of that type of stuff. Unfortunately there weren't too many apps made to take advantage of it so the programmable aspect really didn't end up helping too much. Reeve Software did release a Paint, Write, and News Station for it (I think we released a Diamond News Station?), as well as a developer's kit. Anyhow...hope the 3.0 ROM helps...I'm an emulation fanatic and I certainly appreciate what 'Yogi' did a couple years ago with maintaining the big Atari 8-bit archive (I contributed many files myself) and I love to see this stuff kept alive for the history books.

I've got a disassembler listing of the XL/OS that I fixed up using the listing of the 400/800 OS. Really the only new stuff in it is the parallel bus loader code. Lot of things in there that they never used, for chaining device handlers together.

Message-ID: <NU_%1.17$I4.1021258@newsfeed.avtel.net>
Source record: 58652

For the past several days, I've had a lot of trouble making disk copies on my Atari 800XL. I believe I've narrowed down the problem, so anyone reading this, please correct me if I'm wrong.

I'm attempting to format and copy to a High Density floppy disk as opposed to the Double Density disks I used back in the days when Atari was still around. Will my problems go away if I can find Double Density unformatted disks and dump the High Density disks?

Also, does anyone know where in the world I can find Double Density disks these days?

Thanks,

Mike

That was the first thing I bought when I got my 1050 :) That purple spiral bound book got very well used. It came with a disk or two with lots of basic code. I think my first few games were written using code from it. And the whole cartoon feel was great. Actually made me want to read all of it. Unfortunatly it was part of my collection that got destroyed by a flood. I did find a backup disk I made of my programs :) I don't know if any of it is from dr. wacko.

Omnimon is awesome, anyone wanting to write programs can use it. The value of a debugger always available is great, plus the mini assembler for quick changes. You dont have to worry about your code overwriting your debugger, etc.
Also, yeah, it was a good copy protection removal tool, but, like disk editors and the like, it has a myriad of uses.

I wouldn't say totally useless.... it will still keep time and for
the most part the date. Day of week will be wrong but that can be
ignored. Also, the day of month would just need to be manually reset
for those months that are a different length in the new century. So
for the most part it is still a usable device, just not totally
maintenance free.

Yes, your problems would then disapear. High density disks are NOT
compatible with 360K type disks. Many people often make the mistake
of assuming that because a 1.2M floppy is designed to hold more than a
360K floppy it can more than handle being used as merely a 360K disk.
That is quite false. The two disks use completely different magnetic
coercivity coatings and write voltages.

>Also, does anyone know where in the world I can find Double Density disks
>these days?

Sorry not off hand. Maybe Radio Shack still? They did a few years
ago when it seemed no one else was. You might try searching the net
for suppliers that have old stuff like that too.

Many moons ago, Mike Hohman (sp?) stopped in at my place for a visit. He left behind a bunch of ICD stuff, like SDX manuals and some other stuff, maybe R-Time8 books too. While he was here we fiddled around with the source code he had bought off ICD. I'll have to check, but I think I've got the source for Action!, Mac/65 (disk & rom ver). SDX-the cart and a disk version of SpartaDos, I think it's the unreleased 3.5 version. There might be other stuff, it's been a long time. I've also got Mike's (from ICD) infamous assembler/linker that was used to create this stuff. Nobody at ICD including the guy who wrote it knew how to use it which I found amusing.

Anyway, if there's any interest in any of this stuff I can search around for it. I always wanted to upgrade Action! myself, and I did get a version working that didn't need the cart.

: >
: > Any information?

: That was the first thing I bought when I got my 1050 :) That purple spiral
: bound book got very well used. It came with a disk or two with lots of basic
: code. I think my first few games were written using code from it. And the
: whole cartoon feel was great. Actually made me want to read all of it.
: Unfortunatly it was part of my collection that got destroyed by a flood. I
: did find a backup disk I made of my programs :) I don't know if any of it is
: from dr. wacko.

Spiral bound, eh? My borrowd copy was soft cover.

I remeber it advertising other books in the series. Did they ever come
out with the other ones, or wa it just the game design one.

Remember the hollandaise sauce? And the angry camels... ;-)

Would it be possible to also release the Developer's kit? Even though I sold off my copy a few years ago (oops!) I'm interested in seeing how to write programs. Thanks

David Paterson

Hell yes there is interest in that stuff. Since nobody owes Mike
anything (quite the reverse actually) why not dig and share?

> That was a no go.

It's a typo, note: FFFF, which is obviously a 16bit word. The limits of a
<=16bit address bus and an 8bit data bus define what we would call an 8bit
computer. This excludes the 8086 and 68008, which obviously aren't 8bit
processors.

You could try MEI, the mail order company. Last I saw they had both
brand name and generic DSDD, 5.25" floppies. The generics make sense if
you're looking for quantity, but don't come with labels (MEI sells those
separately.) I don't have their address handy, but they usually
advertise in Computer Shopper, etc.

Mike,

As has already been said by others, you can't use high density diskettes in a double-density drive. If you, or anyone else, needs some (or many) 5.25" double-density diskettes, I have a boo-koodle of used diskettes which you can have for 'real cheap'! Most contain PD/shareware stuff which will need to be erased (unless of course, you decide you want the software). In any event, let me know if you're interested.

Cheers Yogi, that's why I was surprised to see James use it for so
little. God, it speeded some of my menu coding and other fiddly stuff a
hell of a lot.

A damn fine gadget...:)

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design

Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a subsidiary of Midway Games Inc. (NYSE:MWY). The Atari Games Corporations home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge

Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. (AMEX:HAS). Hasbro Interactive has expanded its charter to include original and licensed games for the PC, the Sony PlayStation(tm) and for multi-player gaming over the Internet. Headquartered in Beverly, Massachusetts, Hasbro Interactive has offices in the U.K., France, Germany, Japan and Canada.

Atari: http://www.atari.com/

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer... The ATARI 8-bit could also be made to speak using SAM (Software Automated Mouth) by Don't Ask Software. It can speak without the use of any hardware modification.

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative
in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:nbs@sonic.net (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
60 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors
---
2 0 Char 40 x 24 1 *
3 - Char 40 x 19 1 *
4 12 ++ Char 40 x 24 5
5 13 ++ Char 40 x 12 5
6 1 Char 20 x 24 5
7 2 Char 20 x 12 5
8 3 Map 40 x 24 4
9 4 Map 80 x 48 2
A 5 Map 80 x 48 4
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video
incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four

2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display
List - a program which is executed by the ANTIC graphics chip every
screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a (PIA). However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display

list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

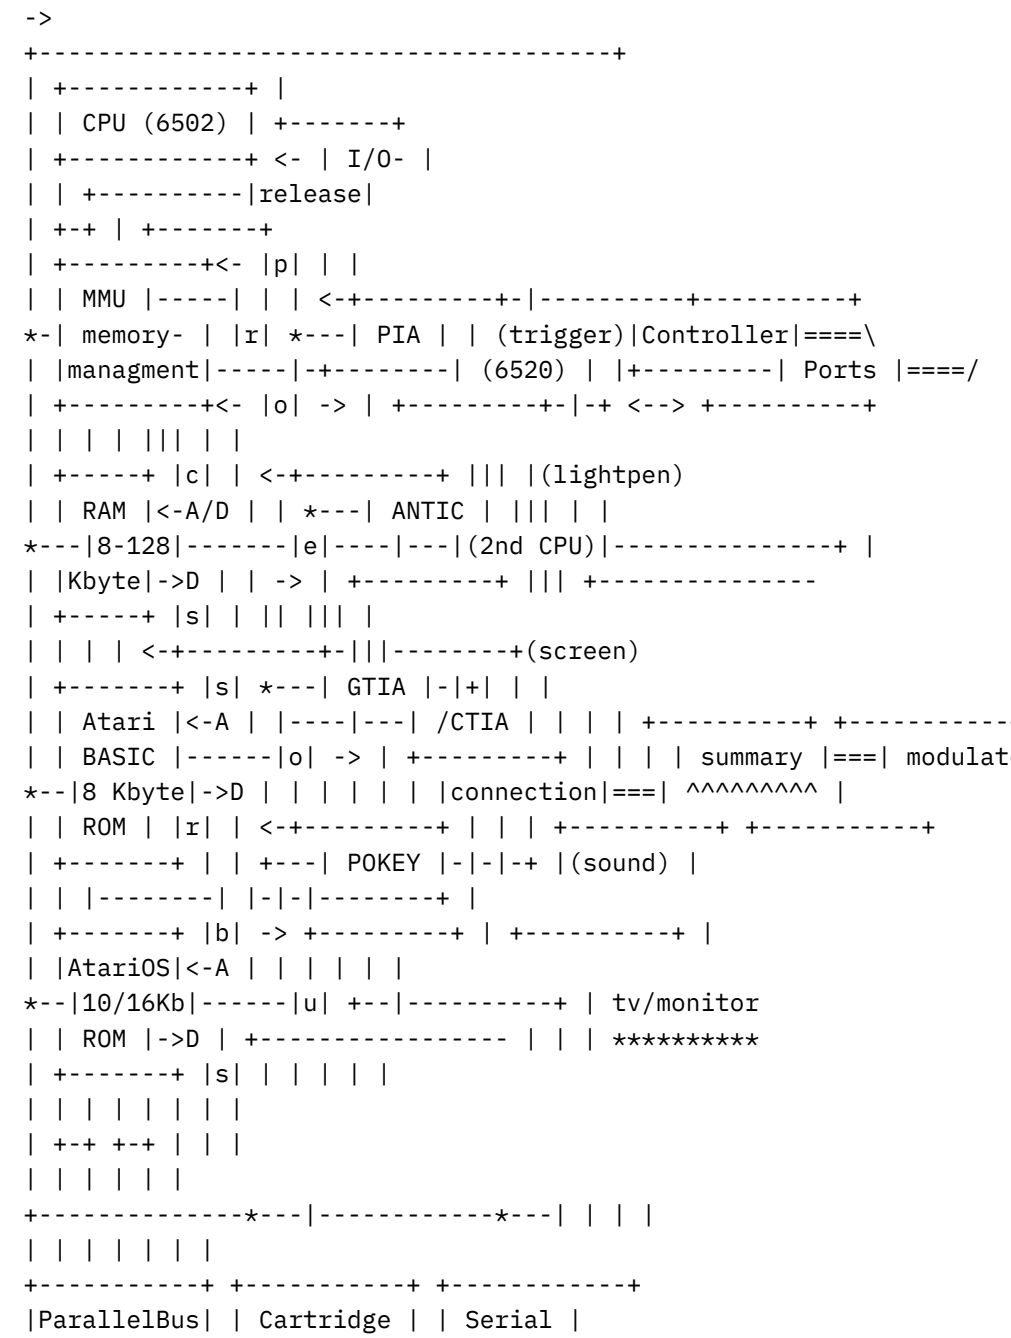
The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have A special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip

(Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.handshake.de (Thomas Havemeister))



```
|Interface/ | | Slot | |Input/Output|
| Enhanced | | ROM | | (SIO) |
| Cartridge | +-----------+ +------------+
| Interface | | |
+-----------+ | |
| | |
- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos ) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

------------------------------

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home
Computer Club" in issue 3 - Summer 1983. The magazine was the official
mouthpiece of Atari UK. The article was not attributed to any one person.
The words are thiers, not mine.

How Atari Got It's Name
-----------------------

The name Atari actually comes from Japan. And yet the company is most
definitely American. Every wondered why? It's an interesting story and
one well worth telling.

In 1972 three friends decided to invent and market the first commercially
feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a
remarkably small sum when you consider the company's success! The next
step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three
friends came across an interesting entry under "S". The word was Syzygy,
or "the straight-line configuration between three celestial bodies". What
a perfect name they thought, for three such astronomically talented people!
```

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Atari related hard/software announcements. (Moderated). Dead newsgroup?
Moderated by Yat Siu, mailto:lexicor@world.std.com

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

atari8-l mailing list

created especially for discussion about ANIX project (unix for atari8),
but any atari 8bit related threads are welcome. english language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

there is also mail2news gateway that translates all postings on the list to
easy to read usenet articles, available read-only to everyone at:
news://zwieracz.ideefixe.nom.pl/listserv.atari8-l

the atari8-l mailing list is available as well as a newsgroup listserv.atari8-l
on public newsserver zwieracz.ideefixe.nom.pl .

there is also archive of all postings that appeared on the list (well, in fact
almost all - about first hundred is missing).

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

(There's an old list called INFO-ATARI8 which is actually still alive. But
knowing about it is know longer necessary, as 100% of its postings are cross-
posted with atari8-l.)

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by
mailto:nbs@sonic.net (Bill Kendrick), designed to provide much-
improved access to the various PD/freeware/shareware Atari 8-bit software
archives available on the Internet.

XL Search is located at: http://www.sonic.net/~nbs/xlsearch/

You can also access XL Search via e-mail! Send mail to:
mailto:nbs@sonic.net with the subject "xlsearch" for details.

mailto:nbs@sonic.net (Bill Kendrick) himself writes:

http://shareware.com/ , c|net's FTP-site search engine, now includes
the Atari 8-bit files at UMich!

Unfortunately, being under the previously-existing "Atari" category,
the files are now pretty mixed in with the ST stuff. I've talked to them
about fixing that. No reponse yet (they're really slow that way)...

Anyway, so now you can use http://shareware.com/ to find Atari stuff..
just be careful what directory you pull it out of! :)

Remember, you can ALSO use MY MINI VERSION OF SHAREWARE.COM!....

XL Search, the Atari 8-bit FTP site search engine!
If anything, it's much less cluttered than Shareware.com! ;)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:nbs@sonic.net (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory
"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are
several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can
I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You
might also suggest what permanent 8bit subdirectory you'd like your file to
end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:nbs@sonic.net
(Bill Kendrick).

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no (Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate directory. Please include a readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only) on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff from all the world. Also, you can download big amount of slovak and czech programs for 8bit Atari only from this archive. And finally, because this site is created and supported by slovak computer group GMG, most of our products can be found right here.

If you want to place here your program, just send it to me (with some comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

The Cleveland Free-Net now has a home page:
http://cnswww.cns.cwru.edu/net/easy/fn/

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 6.1) What is FidoNet?

[NOTE - Michael didn't write this section. If you know who did, I want to give that person proper credit!]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://docsplace.dyn.ml.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 7.1) What is the Atari 8-bit Computer Web Ring?

A WebRing is a set of web pages that have been linked to each other. Basically the first page in the ring has a link to the second one, the second one to the third, the third to the fourth... with the last page linking back to the first. This is all done by adding a small piece of HTML code to your page, which will automatically keep track of where your page lies in the WebRing. In this way pages from all over the world dealing with similar subjects can be linked together. In our case the subject is Atari 8-bit computers, so all pages in this WebRing are about the Atari 8-bit.

The home page of the Atari 8-bit Computer Web Ring is at:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

and the ring is maintained by Raphael Espino, mailto:rje@co.umist.ac.uk

---

Subject: 7.2) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.....

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load
file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot
disk and making an atr, xfd, dcm or other disk image type
file out of it, usually for use with an emulator. Before
emulators, the Bob Puff .dcm format was used to
store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large
number of special formatting that couldn't be copied using
ordinary sector copiers. Usually the boot process involved
checking to see if a certain sector error occurred, then
proceeding. If the error did not occur, the disk was a copy
and would not work.

For carts, usually the method of protection was to write to
the cart area of memory and see if the value changed. If the
value changed, the cart program was in RAM, not ROM and

would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a way to store all software that has been recorded on cassette tapes on the hard disk of your PC. I have written a program that is similar to the SIO2PC utility written by Nick Kennedy. But this one is intended for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free disk space to work with. The sound card should be able to sample sound at a sample rate of 44.100 Hz mono. The sample must be recorded into a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file. The .cas file is a digital cassette image file that only contains the data that is on the cassette tape. Once you have that, you can throw away the .wav file. The .cas files are typically 16 to 64K, so they are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette image) you do not need a sound card. You do need a SIO2PC cable or similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.geocities.com/Hollywood/Lot/4205/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80

File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on

either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a
male DB9 to male DB25 modem cable to connect to your
modem. So why not use this cable as your null modem
cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy

stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001 "California Access"
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002 "California Access"
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB

= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- UltraSpeed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek

- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at

one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video"
(sometimes called Commodore video on Commodore monitors), or S-Video.
These monitors have separate color and luminance video inputs, which
give a sharper picture without cross-color artifacts - such as the
colored fringes on text when viewed on a TV (although some games use
these artifacts to get additional colors). If you have an XL
computer, then it needs an upgrade to support these monitors due to
the omission of chroma from the monitor port. the 800 and XE
computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video"
(usually called just "Video" or "Aux") input. This is a signal that
has the color and luminance information combined into one signal. The
picture will be a little less sharp, but still much better than using
the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests,
and in newsgroups like this one. Plus, many new TV's support S-Video
and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness
(luminance) signal. These are passed to the monitor port as Chroma and
Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal
which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the
process of being "modulated" into a TV radio signal (channel 3 or 4).
This step involves removing high frequencies from the video (blurring
it) and sending it to the TV in a fragile broadcast form that's
suseptable to all kinds of interference. Then the TV must (1) extract
the video signal from the radio signal, (2) separate the Chroma and
Luma components as best it can, then (3) divide the Chroma in R, G,
and B. Any of these steps that you can eliminate will help your
picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is
probably the Commodore 1702 which has a very good picture and is quite
reliable.

If you plan to use an XL (which I do), upgrading the video circuitry
makes as big a difference as what monitor you choose. Ben Poehland has
some excellent articles in Atari Classics magazines for improving the

quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks.

SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on disk or in a 16K ROM cartridge from K-Products.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI (Europe: includes ECI)
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was

the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE-- demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:F.Offenga@student.kun.nl

The following Operating Systems exist for the Atari 8-bit:

Rev. System(s) Models Size Part Nr(s)
~~~~~~ ~~~~~~~~~~~ ~~~~~~~~~ ~~~~~~ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
A NTSC 400/800 10kB CO12499B, CO14599B, 12399B (*)
A PAL 400/800 10kB CO15199, CO15299, CO12399B
B NTSC 400/800 10kB (?)

B PAL 400/800 10kB (?) (*)
1 A NTSC/PAL 1200XL 16kB CO60616A, CO60617A
1 B NTSC/PAL 1200XL 16kB CO60616B, CO60617B (?) (*)
1 NTSC/PAL 600XL 16kB CO62024
2 NTSC/PAL XL/XE 16kB CO61598B
3 NTSC/PAL XE 16kB C300717
4 NTSC/PAL XEGS 16kB C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Alan Manuel K. Gloria, mailto:mani@pworld.net.ph adds:
Revision B on the 400/800 does exist -- it is referenced to a lot in
Mapping the Atari by Ian Chadwick, and is used on most Translator disks
for the XL/XE

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:sposey@ioa.com (Steven E. Posey) (Party Quiz controllers description)

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a
box with
2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before
connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine

and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the

TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz (NTSC use 60hz) which translates into more vertical blanking time for demos and other computation-intensive graphics software. So PAL demos that won't work on NTSC machines are usually returning from a VBI (vertical blanking interrupt) too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough to notice the difference, so all system timings like the keyboard auto-repeat function depend on the TV system. These parts of the OS have been corrected with OSB and the XL versions of the OS. However, as most games install a VBI, their timing does still depend on the frequency -> they will run slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the Xl computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages for the Atari 8-bit computer. This information will include; title, last version, author, date and a short description.

It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, mailto:F.Offenga@student.kun.nl
==========
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]
Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- LADS, written by Richard Mansfield of COMPUTE! (for Commodore computers)
and ported by Charles Brannon to the Atari, is a very good 2-pass
assembler supporting assembly from memory AND disk [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]

Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).
- 6502 Cross-Assembler "xa", 1997 (Andre Fachat) [D]
written in GNU C.

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]
- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A. Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application

that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you
can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original
Atari 400/800. Most probably do work on XL/XE's if you use a translator to
run the original 400/800 OS on your XL/XE.

Subject: 13.17) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 13.18) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

http://www.holyoak.com/atari/

Subject: 14.3) Where is my nearest 8-bit Atari user group?

Rich Tietjens, mailto:atari@teleport.com maintains an Atari computer user group list at:

http://www.teleport.com/~atari/ugbbs.htm

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:nbs@sonic.net (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

See: http://www.sonic.net/~nbs/atari/info/emulatorfaq.html

If you'd like a text-only copy, simply send e-mail to mailto:nbs@sonic.net with the subject:

send emulator faq

Subject: 14.5) Can I use an emulator to run my old Atari software on my new computer?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:nbs@sonic.net (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

See: http://www.sonic.net/~nbs/atari/info/emulatorfaq.html

If you'd like a text-only copy, simply send e-mail to mailto:nbs@sonic.net with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by David A. Paterson, mailto:david_p@storm.ca or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without nearly all flickering (depends on the source-picture you use)... HARD stands not for HARD or HEAVY Interlacing, just for the inventors...

For more information, see the HIP-FAQ, located at: http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin, mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

Unless the surface of the disk is damaged, you can just remove the disk from the warped jacket and slip it in a good jacket. Works for me!! Try it.

Bob

After the demise of Michael Schoedel, realise that all of us can not live forever. I own several copyrights to Atari 8-bit (over 300 with BBS Express! Pro) all modules ect. What I would like at my age of 60 would be someone intrested in not paying the $3,000.00 plus for these rights and all the time involved to create the software, but someone younger with the enegery to continue the project of keeping the Atari 8-bit alive.

The program, source code from what I have received from Keith Ledbetter until the presant day, all inbeteween what I have will be furnished for the price of $400.00..Not negociable, comes with manual text on disk file or via the internet, with all node numbers registered text file, and text doc, manuals are on ibm word perfect 5.0..but can be converted.

interested offers reply e-mail.

I also own Hard Back and restore. Paid $500.00 for it, comes with source code and manual docs on computer format..source on disk manual on disk. Make offer.

DK-Utilites for the Black Box and MIO and BBS Express! Professional command modules..make offer..

Life is short may someone younger meet the challange..

I have some other stuff if interested in persuing items ask via e-mail.

Bob Klaas...

Turning over the key to the future generation.

3811. Creating an Online Resource for 8bit Ataris

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-04 00:00:00 UTC
From: lintilla@my-dejanews.com
Message-ID: <71o8hc$ri5$1@nnrp1.dejanews.com>
Source record: 58785

Does anyone know with reasonable certainty, who actually has the copyright to all OS manuals for the 8 bit machines. Did Jack Tramiel inherit them? or do Warner Communications still hold the rights? The reason I ask is, I would like to proceed in creating my own hypertext version of "everything" relating to Atari 8bit machines. (and it's a lot) I'm not interested in reproducing the originals as this clearly is a breach of copyright. All that I am trying to do is bring together related material on the definitive aspects of system. Here are some of the sections I'd like to cover...

Overview of System Organization
Hardware (clock generation, timing resources, memory access priority)
GTIA and ANTIC vs 6502 (NTSC and PAL)
POKEY I/O + audio and hardware interrupts
Memory Usage (OS, ANTIC, 6502, Carts)
Character Sets
Playfield DMA/Player Missiles/Hardware Scrolling, cycles lost.
Disk Drives (I need more info for this)
Device Drivers inc. R:

etc. etc.

Ideally I'd like to put this on the web but need more feedback on the issues mentioned. If you feel this is a worthwhile venture and the web is a no-no, maybe we could find another way to get this done. :-)

I look forward to your views, and maybe more info on Disk Drives.

Lintilla.

< technology is obsolete when it ceases to offer any >
< worthwhile benefit to the user.

Here's the final Diamond GOS ROM image...precisely 64k...burn it to a 27512 and you'll be set. As usually I take no responsibility for any side effects in doing this. You're free to distribute it...add it to Atari archives...make emulators that work with it...whatever... Sorry if anyone is bothers with binaries in this newsgroup, but it's only 64k.

3813. Pooldisk Too Released

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-04 00:00:00 UTC
From: bo.schreurs@stackbbs.xs4all.nl
Message-ID: <910139651@stackbbs.xs4all.nl>
Source record: 58787

Hi everyone,
just wanted to let you all know that we released
the Pooldisk Too cdrom as of October 24th.
The ABBUC's yearly meeting (JHV) was the trigger to
release the cdrom.
We've spend some time to make the sleeves of the
cdrom attractive as well this time.
Anyway, as of now you can order a copy of this
2 disk cdrom set if you want for just $20,
and that includes shipping to anywhere on this planet.
You'll get approximately 5,000 .ATR disks for this,
a lot of pictures, scans of covers, some internet
related thingies, an electronic version of Mapping the
Atari, pc programs, st programs, and a lot more.
Both disks are almost completely filled.
Remember all the material on these disks are pd
freeware or shareware, or put on there with permission
of the copyright owners.
You won't find any illegal programs on it.
For some of the material, we have been granted the right
to put it on the CD, with the restriction that the stuff
is not be copied further, so for personal use only.
Anyway, enough of this legal stuff.

If you like a copy, send a money order or a check drawn
on an US bank for an amount of $20 to:

Ernest R. Schreurs
Kempenlandstraat 8
5211 VN Den Bosch
The Netherlands
Please include a note telling us the shipping address.
If you have any questions, feel free to send email
to ernest@wxs.nl or send a letter to the above address.

Thank you.
Bo Schreurs
co-creator of the "Pooldisk Too" cdrom(s).

Isn't it interesting to look at diskettes from
the early 80's and then look at them now?
Lots of the early ones look like they were
"polished" with 100 grit sandpaper (ok, slight
exaggeration). While today's look like
mirrors. There is more to diskettes than that
for sure, but I've found it to be a pretty fair
gage of quality. I've bought diskettes from
MEI before, and found them to be very good.
Larry

Jeff, I think there is a lot of interest in this. Am I the only person that doesn't have an Action! cartridge? It seems like every time one is mentioned, it's a mad dash to see who can get there first. After seeing Bill Kendrick's game, I have been wanting one myself. Just can't seem to be fast enough. Keep us posted.

>I wonder about how many of each were made? I heard that a lot (>200 815's)
>made it
>out the door. Anybody have any numbers they think might be close?

According to assembly line notes approx. 450 units were produced, most were recalled back to Atari since they didn't want to sell the product.

As for the 1450XLD's, a 1st batch of 75 were done, 150 total shells exist, very few TONG motherboards are known to exist, 8 were shipped over from Atari WONG in Japan.

>What the hell is an 815??? Anyway, i

An Atari 815 was a dual drive unit with 2 360K disk drives. For more info, go to www.atari.nu select Atari Computers, Atari 8bit Computers, Atari 400/800 then select Atari 815 Dual Disk Drive.

I just purchased 2 boxes of Bonus DS/DD 5.25" disks as Office Max about 2
weeks ago. Price was reasonable and they appeared new. Have they
discontinued them? Guess I better go back and stock up.

Source record: 58594

After owning an Atari 400 and then a 600XL in the early 80's, I have used Mac's and PC's since then, I have always missed the great games that were available on the Atari. Is there an emulation programme to enable Atari programs to be run on an Mac?

I also have access to a PC is it possible to do the same on a PC (assuming you can't on a Mac). How do you do it, where do you purchase the emulator?

Cheers

James

Goto John Stiles' Home page at 'http://www.komkon.org/~stiles/index.html'

In the section 'emulation.net' he has Atari 8bit Emulation software.
As well a whole host of other systems.

You will need other sites for software. But most emulators on the Mac seem
to understand the .ATR format.

Better yet, you can buy the video. Just email to this address:

santora@earthlink.net

Mark Santora made an excellent video of the show which includes
the guest speakers. It was such a big success, next years show
is in the planning stages. Check it out.

>
> Could somebody tell me if and how I can recreate the RW-LATE signal on an
XE
> computer?
>

That signal was probably dropped due to lack of use.

Your probably not going to like this, but looking at a schematic of the 800
here is,
briefly, what circuitry is being used to create it:

Phase 2 buffered is generated off of a 7474 flip/flop which is fed Phase 0
and clocked
by a NOR gate that is inverting Phase 0.

Phase 2 buffered is then sent to a 74LS00 NAND gate. One input gets Phase
2 buffered
and the other input is fed by a delay line. This delay line consists of 3
inductors (unknown
values), a 470 ohm resistor, and four capacitors (two 47pf, two 68pf). The
output of the
NAND gate is called W/TIME (not).

W/TIME (not) is then inputed into a 74LS32 OR gate and OR'd with the R/W
line. The output
of the OR gate is R/W LATE 1.'

Now since Atari had changed the type of chips and components used to
generate timing
signals used inside their 8bit computers with the 800XL and 130XE. Who
knows what is
usable in there to accurately re-create that signal. The 130XE uses the
Freddie chip for
most of it's memory refresh and timing circuitry.

But if there is anyone who can make a final yeah or ney on this it would be
Bob Woolley.

By the way, what need do you have for such a signal? Do you have an old
800 cartridge
that needs that signal?

Hello,

Note that Mr Paul Finch (Portfolio Club U.K) E-mail address has
changed from pfinch@mettav.demon.co.uk,
To: paulfinch@x-stream.co.uk
The telephone number stays at +44 (0) 181-286-8990 (answermachine)

Please pass this information on to one other person.

Also:

WHAT HAS HAPPENED TO THE TAVERN BBS?

Can anyone help me with the above, which is a London (England, U.K) based BBS.

I was logging onto them approx once a week when suddenly the number just
started to ring and ring but does not log on to the BBS. Yes, all my computer
equipment does work as that is how I got here!

I have even wrote to Mr Paul Baker (the Syops) but no reply!

HELP, does anyone know what has happened to 'The Tavern BBS'?

Paul

<Spit@spam-free.UUCP> enlightened us thusly:

>The limits of a <=16bit address bus and an 8bit data bus define what we
>would call an 8bit computer.

No, that defines what YOU would call an 8bit computer

>This excludes the 8086 and 68008, which obviously aren't 8bit processors.

8086 - 16-bit, with a 16-bit data bus.
68008 - never used it, so dunno
8088 - questionable (16-bit registers but 8-bit data bus).

The 8088 does indeed have 16-bit registers, but it addresses memory in
segments of 64K (sound familiar?) and communicates with the rest of
the world 8 bits at a time.

Yeah, actually it did. I always forget that feature. I havent used a
plain vanilla xl os for ages (except on the emulators)
I guess for an emulator omnimon would have limited use, since the
emulators have debuggers built into them, but the convenience on a
real atari is amazing. Rather than flip the power on and off and
cause memory stress (slow refresh 256k upgrade in my 800xl!) I would
pop into omnimon change $244 to non zero and hit reset

I ran into this same problem awhile back. I found some disks at Radio Shack for the $6.99 price (a rip off but I need 'em). I didn twant to fiddle with mail order.

Since then I found them at my local Walmart for $2.99 a box..

I also found them at a NC Walmart in a closeout sale for $0.50 a box! I have a nice little storage of DS/DD disks to last me quite awhile.

Later,
Steve

Brix wrote in message ...

:The limit is just to exclude too fast machines, so we get a rather fair
competition.

Okay then, let's say a 6Mhz limit. Although I'll revise my opinion on that
if anyone can name a 6502 based machne that is doing more than about 3 or
4Mhz.

[cartridges]
:> If not, what about if you stick to 64K ram and no keyboard, making it
:> compatible with the GX4000 console?
:
:Sticking to 64K ram would disqualify the C128 and the CPC6128 which still
can be compared
:to a C-64 or CPC664 or Atari 800xl, so the 64K Ram limit would be unfair.
:The machine may have a Keyboard, but does not have to in my opinion,
because a NO
:KEYBOARD-rule would disqualify the NES,the C64gs and the Atari 2600.

Erm, actually I was still refering to the CPC+ here. For those that don't
know, a GX4000 console is a sort of basterdized 464+. The keyboard (except
the P key) and tape deck are missing, so you can only play cartridge games.
I was just wondering if they were excluded, because you *could* write the
same demo on a full blown CPC+ that loads from disc (although it might be
more complex without the advantages of ROM banking).

:> I just fancy writing a GX demo really...
:
:Then do it :) if the GX is below 6 Mhz, has an 8 bit proz. it is just fair
to compare it
:with the others isn't it?

I'll take that as a yes then. Although the whole recording to video gets
more complicated if you can only run it on a emulator, surely?

:Huh, so how do you think we should make the voting?

Well we could just trust people to vote on the merits of the demos alone.

Then again, maybe not. :-)

:> :I think to show the best of all is the best solution. So we get a clear
:> impression what is
:> :possible, and not what os possible in time. Let the best compete with
the

:> best. No
:> :deadline.

I think unreleased demos only would be better. That way you don't have to worry about how many demos come from each scene (you're unlikely to get more than 5 at most) and at the end of the event every platform that took part would gain some new demos. That way, even the losers win. :-)

:> Does the C64 come under a different category to the C128? What about the CPC
:> and Plus machines? Or the Speccy and SAM? (tricky one that)
:
:No categories. Just one competition.

Bad choice of words on my part, I should have said "scene" instead of "category". SAM owners, for example, wouldn't like their machine to be classed as a spectrum. *But* if you seperate Speccy/SAM, it becomes a bit unfair to pair CPC/CPC+ or C64/C128.

:Another way of voting would be to show all the demos mixed, without telling the system it
:belongs to, and let the whole partypeople decide which demo is the best. For that we could
:even allow selfvoting, as the PC-Scene is voting too and selfvoters will get less
:important then. Since most PC people do not always know which demo comes from which system
:(they may guess, but they can't be always sure).

The problem is that it'll be obvious in some cases. Spectrum graphics stand out a mile and I suspect a lot of PC owners, perhaps more than you think, would recognize them.

:For 15 Demos, the first demo will get 15 points, the 15th demo gets 1 point.
:This however requires, that each scene gives exactly 5 Demos to the competition, when
:there are 3 scenes.. if a scene cannot provide such an amount of demos it is rather bad
:for it, but the major scenes will be able to chose 5 demos, will they?

Depends how you define each scene. See my point about SAM/Speccy above.

:the same applies to the C128, where I know NO demo (I think there exist a few, but I
:haven't seen one yet).. Although I am a Commodore-lover, I would say: Bad luck.

Just doesn't seem a great way to get the obscure machines involved. I'm sure the CPC+ would sneak in somehow anyway. In the form of Palatine (when it comes out) or something. :-)

:Well, it is surely possible to get a composite signal (like Choma/Luma or linear RGB) from
:the CPC's port, isn't it? Both can be conected to a Videorecorder's SCART cable and thus
:provide a picture that is good enough. C64's Hires will be somewhat worse than on a
:monitor too, but as this is a problem for all machines it isn't unfair.

It isn't a problem for all machines though. Only those with decent graphics. Speccys certainly won't suffer. ;-)

:How do you want to vote on the net? I mean I could use a mailbomber to send you
:100,000,000 votes for the C-64 scene under different names.

Limiting the voting to regular posters to 8 bit newsgroups would work, wouldn't it?

:How can I watch the demo, when I have no CPC here and my Computer is too slow for an
:Emulator? When I cannot afford to download 100,000 MB of Mpeg?

Okay, so I accept that point. But surely it is going to be easier for more people to watch demos on emulators than to spend three expensive days in Denmark just to visit a demo competition. People get excluded either way, but my way would probably work out cheaper for most people.

:Believe me, the whole C-64 scene also cannot be on a big party, but the result is somewhat
:fair anyway. I don't know how often you have been on such events, but I can tell you from
:my experience that this is a very common way to do competitions on the C-64 and this way
:is accepted as being fair by the whole C-64 community.

If it was going to be a convention, then it really ought to be one in the UK, IMHO. Most of the posters to c.s.s, c.s.c and c.s.a.8 seem to be from the UK.

:I can't also be there, but I'm a hell of interested which C-64 releases there will be..
:and if there is something released I can quickly suck it from an FTP Site.
:I also don't worry that the votes will be unfair.
:Just the way it is.
:Who sais that only the 8Bit scenes may vote? Let the PC people vote too, and you get an
:even fairer result with less patriotism.

PC people might vote? Well I'll just write one of those tunnel effect things then, they seem to make up the majority of PC demos I've seen.

:Well, if we say that only the real important machines take part (the unimportant ones are
:rather unlikely able to collect enough demos) then it'll be no problem.

There is a very big assumption here though and that is that all CPC6128s (for example) are the same. This is most *definately* not the case and certain demo techniques will only work on machines with certain makes of CRTC (one of the video chips). So you might have access to a 6128, but only one with a crap CRTC and some demos either won't run, or will skip certain sections.

:We even managed to do an ACORN-Democompetition, even though their monitors are another
:world (that beast has so damned many screenmodes, that it is uncountable - so the
:monitors are quite scary too).

CPC machines have absolutely *loads* of possible screen modes. They also use lots of tricks that involve fooling the VGA (the *other* graphics chip) into thinking a VSYNC or HSYNC has occurred, whilst knowing that the monitor won't recognise it. I'm not entirely sure how that would come out if you were using SCART or whatever.

Fraid not, it was a pure Op sys swap with enhanced commands. But you
could use it to rip that nice GR.9 Translator front-end :)

And stop missing it and run he emulators..Atari800+(win) are damn near
perfect :)

Did anyone have a play with that rom, I found that a boot with SELECT
held down forced it to initialise in this 80 column mode BUT the
character base was wrong.

I seem to remember there was a system call that set it up.

Anyone remember this call?

I swear this is the 80 column rom that could be used with things like
Hitch-hikers etc but there's no identifying characters when you hex read
it.

Greetings programs. My son and I were trying to recall his favorite atari games from when he was 8 years old. So far we have remembered and found run for the money, dog daze, dandy, goonies, and snowball fight. There was one game we couldn't remember the name of. It's a platform game with two knights. One has a sword and the other has a shield. Kind of bounty bob sized characters. Basic goonies goal, get from one part of the screen to another. Does that sound like an atari game?

Thanks :)
Mark

3843. 800 repair help?

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-05 00:00:00 UTC
From: Aaron Christopher Finney <A_Finney@wfi-inc.com>
Message-ID: <3641F5C8.238E14C1@wfi-inc.com>
Source record: 58617

I just picked up a broken 800 for fun and am just starting to take it apart. Here's what it _does_ do:

1) Both power leds come on
2) The screen receives a signal - pure black with the OS card in, orange with it removed.

Any idea why the color change with the removal of the OS card? I did the preliminary check of the PS and re-seated all the IC's on the CPU card, OS card, and mainboard. Now what? Are there any common points of failure that could explain this?

Cheers,

Aaron

3844. My 130 died

Newsgroup: comp.sys.atari.8bit

My 130XE (unmodified) died.
Does someone have a clue where to start 'repairing' ?

I was working on my PC because i couldn't get my modified 130XE
working with APE anymore.
So i took my other 130 and hooked it up. It worked for a few secs but
after that i only got a black screen.
Now when i power it up, i see a brown screen, as if there is no OS.
It was 'brand new'.

HELP!

Louis

(if someone in Holland/Germany can repair my 130XE maybe i can ship it
to you)

Maybe the APE cable you are using is defective, has partially burned
out, etc. and is blowing your Atari's that get hooked up to it.
Dunno.

Hi! I'm looking for some old Atari games and would like to trade newer PC games for them. I'd prefer original boxes, manuals, and disks of course, but am willing to trade for just disks or disks+manuals for a better exchange rate.

I have a huge list of PC software and PSX software to choose from, lots of it still in the shrinkwrap. I also have a lot of publishing & multimedia wares, and would be interested in trading those for programming tools & utils & books for the //e.

If you have some Atari software and are interested in potential trades, please let me know. Thanks!

Didn't it also work sort of like a translator? I remember it running some
programs that I need the translator disk for now. Gawd I miss my old
hardware... Mark

For me 8 bit computer means: 8 bit processor, because the CPU is what
computes, not the bus.. the bus only transfers data.

The 8088 is a 16-bit processor with 8-bit data bus interfacing. It is
in fact an 8086 which was cut down to an 8-bit data bus.

Curt,

Your the man when it comes to the engineering info.

I'm wondering, out of those 8 TONG motherboards... how many
had a working voice circuitry? Mine has a working disk drive
and modem, but dead on the voice. And if you can keep an
ear out for what those two 40 pin LSI chips are for on the TONG
boards.

Thanks,

I didn't follow this part of the thread too closely, but did someone mention e.g. the TMS9900 yet, which I don't know much about, but it was supposed to be one of the first true 16-bitters. If so, would a Texas TI-99/4A owner be disqualifyed from the contest?

Maybe the limitation should not be clock frequency or bit width, but the number of Mflops, dhrystones or similar measurement the processor can perform. How does a 3 MHz Z80 or a 1 MHz 6502 compare to e.g. a MicroVAX I (from 1984, which has a VUPS rate of 0.3) ?

No, it defines what is called an 8 bit computer. How else would you describe
an 8bit system? >16 bit address bus or >8 bit data bus?

> >This excludes the 8086 and 68008, which obviously aren't 8bit processors.
> 8086 - 16-bit, with a 16-bit data bus.
> 68008 - never used it, so dunno

So, you agree with me. The 68008 is 32bit internally with an 8bit external
data bus. But it can directly map >16 bits of memory directly so doesn't count
under the above definition.

> 8088 - questionable (16-bit registers but 8-bit data bus).
> The 8088 does indeed have 16-bit registers, but it addresses memory in
> segments of 64K (sound familiar?) and communicates with the rest of
> the world 8 bits at a time.

The Z80 and 68xx series can also operate directly on 16bit words by pairing
registers as does the 8088. The Z80 also has full 16bit registers, as does the
8088. However, the 8088 can address more than 64k, even though it does it in
16bit blocks. This puts it apart from the rest of the 8bit pack which can only
address $FFFF.

The 8080 and 8085 processors, of which the 8088 and Z80 are both derivatives,
ARE 8bit processors.

So you couldn't class the Z380 and Z180 class of CPU as 8-bit, because
they can address more than 64k (1Mb for the Z380, I think @ 20MHz) even
though they are based around a Z80 core with revisions?

-)The 8080 and 8085 processors, of which the 8088 and Z80 are both derivatives,
-)ARE 8bit processors.

I am sure that the 8088 is a cut down 8086 with 8-bit data bus to cut down
on the packaging costs (8 more pins on a package cost a lot back then).

What needs to be done is to get together and make a killer 8-bit computer
- 2 SID chips for sound, 20MHz Z80 / Z380 CPU, CPC+ graphics or better
(e.g. 256 colour sprites), 256k RAM or more.... Shame it wouldn't sell
except to enthusiasts, perhaps in kit form, but it would be cool. make it
the best of all of the 8-bit computers.

Graham

> gets diplayed on an RGB monitor in the so called "letterbox-mode",

YM that a mode with a 15625Hz line rate won't work on many (newish) monitors.
However, any multisync which can cope with a 15625Hz line rate is ideal for
the avoidance of letterboxing; similarly, a TV with a SCART input (better
than using the A3010's built-in modulator).

This is why, for the Risc PCs, we have 100Hz equivalents of the old
TV-standard modes. They don't letterbox and they fill the screen nicely. (Oh,
and modules to fix timing problems in older games which assume a 50Hz refresh
rate...)

They've called some other processors 64-bit simply because of the width of
the data bus... by this definition, the (standard) QL is an 8-bit machine - a
definition with which I expect that many of you will disagree :-)

Actually the real reason Intel made the 8088 after the 8086 was
because there was a lot of 8 bit support hardware out there (boards,
slots, support chips, etc.). 16 bit stuff was newer, in shorter
supply, and more expensive. Builders wanted to be able to use the
cheaper stuff.

:> games better.
:
:What makes you say that ? (except the supplementary memory brought by
:the ROMs of the cartridge).

Things like split screen, DMA sound etc can fill up a large chunk of the main 64K. It can also get quite tricky to arrange sprite images so that you can copy them into the ASIC, since it pages in at the same point as the extra memory (unless you use a CPM set-up.)

With cartridge software you can page the ROM containing your sprites at 8000h or C000h, where it doesn't get in the way. You can also put at screen at 0000h, stick a lower ROM over the top of it and make use of write-through to access more than 64K at one time and keep mode 1 interrupts enabled.

>

The idea of making the 'blind' voting is fine, and that would be easier
with all the demos recoreded on VCR,
BUT it will _NOT_ work for CPC (and properly BBC) demos. Here is the
reason:

The video chip of the CPC (The all famous 6845) is capable of being
programmed to all kinds
of different screen refresh rates, and it is used in _ALL_ demos just
looking reasonable, things like having a
vertical (or even horzontal) sync in the middle of the screen, 45Hz
frame rate, ustable horzontal sync and a lot more of tricks, makes no
problems for (standard) CPC monitors (fx. the Philips 8833, often used
for Amiga, have trouble with some CPC tricks), but a VCR will totaly
fuck-up the picture, it can't sync properly to that kind of signal. I
know, I tried sending a preview of one of my demos (on video tape) to a
contact once, diden't work.

Ofcourse you could say that split-screens are forbidden for CPC demos,
but that's like saying the C64 can't use it's sprites, in other words,
most of the power of the machine will disappear...

> > Finding someone with both knowledge, a CPC+ and the money to travel to

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto
Atari Federation FLEA MARKET! The doors open to the
public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned
hardware and software where you may find that peripheral, application or
utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your
XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any
use for, get yourself a half-table and try to sell it! Or find that
treasure that you have always wanted. Great deals should be in
abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each.
Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member
family but if you are selling and have taken a half-table or more,
admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing
for sellors after 6:30 PM, and teardown after 10:30 PM. This should
allow enough time for as many people inside and outside Toronto to
attend the event.

As usual, piracy cannot and will not be condoned. You must be selling
original pre-owned software only. If anyone is caught selling pirated
software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room"
of the North York Memorial Community Hall on the Lower or Concourse
Level of the North York City Centre Library Building at 5110 Yonge
Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5
stoplights North of Hwy 401 running East off of Yonge

> more complex without the advantages of ROM banking).

Oh, I won't care about that. If it's the machine's advantage, then let the
coder use it.
The C64gs is also not disqualified, that makes C64 coders also able to code
a Cartridge Demo on C64... as long as they can provide a c64gs to play it.

On the other hand we could exclude machines like the GX4000 and G64gs, as
they are 100% CPC* or C64 if you forget about the keyboard.

> :> I just fancy writing a GX demo really...

> more complicated if you can only run it on a emulator, surely?

If you can run it on an emulator it is possible, as some card have a TV
out, or as the Videobeamer on a big event has a VGA input that can be used
by the PC running the emulator.

> :Huh, so how do you think we should make the voting?
> Well we could just trust people to vote on the merits of the demos alone.
> Then again, maybe not. :-)

Yes, I think on a big event where the majority is PC users that cannot know each systems demos (we should show them mixed) it is not likely that they fancy a specific system. Also selfvotes become rather unimportant, when the majority of voters are PC users.

> I think unreleased demos only would be better. That way you don't have to
> worry about how many demos come from each scene (you're unlikely to get more
> than 5 at most) and at the end of the event every platform that took part
> would gain some new demos. That way, even the losers win. :-)

I think unreleased demos make one problem: If a scene got rather small it also lost a lot of good coders and it is less likely that a rather good system whose scene became small will show off with a good demo.
On the other had a still very big scene (like the C64) would have an unfair advantage, because there are more good active coders among them when the scene is big.
So if we can let each scene chose its best demos ever, we will get the probably best possible on the system and not what the left coders can do.

I chose the maximum of 5 demos per scene (i dropped "exact 5 demos" idea, because i want to give a chance to systems who can provide less demos), because of two reasons:

1.Time - on a big event a rather unimportant 8 bit compo won't get too much time.
2.Choice: Each demo has some cool effects, but none can completely show them all in perfection. E.g.: Dutch Breeze by Blackmail has great graphics and a nice "storyboard", while Last Traktor III by Horizon has a very cool Vector part, Tower Power by Camelot has some of both and a very powerful music, but I miss some other effects in there.

> :Another way of voting would be to show all the demos mixed, without telling

> would recognize them.

So what? If spectrum outperforms everyone just with fine graphics it probably won using its best weapon. If the C64 outperforms some machines with crazy, fast, scrollings and crazed out sprites it outperformed the others with its best weapon and if there is a machine that calculates the most radical 3d effects and wins because of this it probalby used its beast weapon (brute force) too.

> :For 15 Demos, the first demo will get 15 points, the 15th demo gets 1

> :for it, but the major scenes will be able to chose 5 demos, will they?
>
> Depends how you define each scene. See my point about SAM/Speccy above.

Oh sorry,.. with "scene" I meant System.
But I forgot about the "systems" ranking meanwhile and prefer a demo-ranking now. Of course the demos name will be told together with the system in the results list (not before, to puzzle people who love to selfvote).

> :How do you want to vote on the net? I mean I could use a mailbomber to

Hm, if i watch my Telekom-bill I doubt that :)
I also think that a CPC owner won't ever buy a C-64 to watch the demos, and even the best C-64 emulator (CCS64) is not perfect and also people with slow PC's will have problems running an emulator at proper speed.
BUT: Why not publish all the demos released on a homepage, so people can download and decide for themselves if the publics judgin was correct or not?

> If it was going to be a convention, then it really ought to be one in the
> UK, IMHO. Most of the posters to c.s.s, c.s.c and c.s.a.8 seem to be from
> the UK.

Hm, why not? I always wanted to go to Britain once.
Is there an important convention (where they show democompetitions too)
next year?
On the other hand I'll do my best to organize something like that in
Germany anyway.

> :I can't also be there, but I'm a hell of interested which C-64 releases

> PC people might vote? Well I'll just write one of those tunnel effect
things
> then, they seem to make up the majority of PC demos I've seen.

Sad but true, but on C64 some demos won because of that too, although
others had a better code. Anyway if that is the fashion, let the people
decide what they like most. I also hate those girls walking on towers
(buffaloes), but if it's that what they like.. let 'em buy it.

> :Well, if we say that only the real important machines take part (the

certain
> sections.

In this case we should make sure that at least one of the guys owning the
better model of the CPC comes to the convention to play the demo.
C64 has has 2 different soundchips in its history. That is why C-64
musicians have to say on which SID they want their music played.. sometimes
the competition-organizers also say "all musics will be played on the new
sid chip).
Both sid-chips have a different sound in some situations. Old SIDs are
better for digitized music, new ones are prefered by some new players.

Hm, on Acorns the problem is that they have a large rabge of Video-signals
they can generate for monitors. You can f.e. plug a VGA monitor to an
Acorn, you can use a SVGA monitor, or a usual RGB monitor (like the 1084s
for amiga). Of course an RGB-Signal won't work on a VGA monitor, while a
VGA-signal gets diplayed on an RGB monitor in the so called
"letterbox-mode", that looks like wathcing the demo through a letterbox
(almost like cinema on TV, hehe).
But as far as I'm concerned the CPC only uses a RGB monitor.

> compared to a cool coded ZX81 demo! (Just to make a point)

Of course, a lame coder makes the best machine look shitty, but I think
that on all popular machines there have been enough good coders. And the
best on each machine are for sure about equally able.

> Unfortunately I haven't see the tread from the start so I don't know
> what the idea with the competition was, but I think a
> demo competition between coders on each machine could be cool, or as
> secondary goal, a competion between coders on different machines.

My idea was to let each system chose it's best 5 demos as contestants and
show all demos on a democompetition at a major computer event, like The
Party (Denmark), Mekka/Smposium (Germany) or similar.
The we let the whole crowd vote the best Demo. As the majority of the crowd
will be PC guys, I expect the "selfvotes" (honest people don't do that) to
be rather unimportant.
After the votes are counted we can make a Ranking list with Demo/Computer
in it (that is of course published on the internet), so the people can
decide for themselves which computer seems to be the best performer.

> But in
> the last case, the judgment should ofcourse be best use of specific
> hardware, making it best 'looks' nomatter what (8bit-) hardware would be

> the old Enterprise system would have a great chance of winning, if one
> could find a good coder for it, as it as I remember it, got some cool
> hardware for sprites/hardware windows)

Some computers have better Graphics, some have sprites but less colors,
some have many colors but bad resolution, some have a fast processor and
some have lotsa custom chips. Every system has its highlight, every one its
bad spot.
I think this 8 bit democompo would be a very cool event for the entire 8
bit computer scene, whether it is C64 or Atari or CPC.
A kind of get-together of scenes who once fighted eachother like MAC and PC
do now.
Let's show the 16bitters and Pentiums, what 8 Bit can do!

>There are more internet users in the U.S. than in the rest of the >world COMBINED.

Not surprising, since internetting is virtually free in the States. No phone costs and only 10 bucks per month to feed the provider. Once this kind of infrastructure catches up you can expect the rest of the world to catch up. But outside the States internet is an expensive luxury at the moment.

If a commodity is dirt cheap in any area then you can expect to see it used widely. I remember from my trip to the Greek island of Paros (which has a thriving marble industry) that humble farmers there use marble to build pig stalls and only rich people can afford brick houses (since it has to be shipped in). In most of the rest of the world bricks are common and marble is a luxury only for the wealthy.

>Most .com addresses are from the U.S. While Atari

Yes, but they're increasingly been used by businesses from outside the U.S. It's cheaper to register, since IIRC the USA gov't has given one company a monopoly and made them set a limit on the costs of registering and there are no rules regarding name use, other than copyright infringements. Hell the other day I found a site called www.godhatesfags.com, no way would that be allowed in most European countries with their censure-loving authorities. And here in the Netherlands only registered companies can register a .nl domain, so anyone who wants their private domain will have to look at a .com or .org one.

>sold a lot of machines in Europe (and I'm glad they did), do not >forget that they sold a butt load of them in the U.S. as well. There >are Atarians all over the globe not the least of which are from the

I think the 8 bit Atari range was far more successful in America than in Europe, where the Commodore 64, Spectrum and later the CPCsold more units. Even the MSX machines were more popular. To bad, as graphics-wise the 8 bit Atari's ruled. If they had a sound chip comparable to the SID then they would have rocked!

Though these processors are irrelevant to the thread as they don't appear in
any mainstream computer I am aware of, I don't consider them true 8bit
processors. They are in the vein of the 8088 which isn't a million miles away
from the Z80 in terms of architecture, but have the extended address space.

> -)The 8080 and 8085 processors, of which the 8088 and Z80 are both derivatives,
> -)ARE 8bit processors.
> I am sure that the 8088 is a cut down 8086 with 8-bit data bus to cut down
> on the packaging costs (8 more pins on a package cost a lot back then).

The rationale behind the 8bit data bus is cheaper system cost. Building an
entire computer around 16bit devices was an expensive proposition at the time
so 8bit was used in preference, with only the processor being 16bit. The
original PC and the Sinclair QL (32bit) are testament to this.

What a load of crap you're talking there mate! Yes, there are a hell of
a lot of americans on the net, but that does *NOT* mean that in a
newsgroup, a lot of the postings will be made from them.

If there was a newsgroup about Bananaman, or the Beano, I somehow doubt
that there would be more than a handful of US readers there.

The Sinclair and Amstrad newsgroups will have more British readers than
american because there were a damn sight more machines sold here than
there.

Actually I think I was quite accurate and objective. I clearly stated
it didn't prove the numbers for readership in c.s.a.8. That is why I
asked for participants to reply so we can all get a true picture of
where we Atarians are coming from around the world in regards to the
ones that participate in here.

>If there was a newsgroup about Bananaman, or the Beano, I somehow doubt
>that there would be more than a handful of US readers there.

Your point? c.s.a.8 is what is specifically at question. And I might
add, the answers are pouring in. Those answers largely have
reenforced what I suspected. It is simply a curiosity to satisfy the
question. No country's Atarians are better or worse than another
one's. We are all gladly here for the mutual benefit of each other.
I am finding it interesting to see some of the places around the world
that the replies are coming from. Very cool.

Regards,

Jon

Well I hardly look at it as free. My phone line isn't free and my ISP
charges almost double the $10/month you seem to think we all get over
here. Granted I'm sure it's cheaper than most of the rest of the
world but isn't FREE buddy. Unless your system radically changes your
infrastructure will probably never "catch up", unless you mean
eventually catch up to where the U.S. is currently. I do not mean
that as a slam like the U.S. is unbeatable. What I mean is that in
the U.S. private ownership of personal computers and technology items
is much more prevalent, combined with less governemnt restriction than
found most other places. Sometimes I think the U.S. is trying to
wreck a good thing by getting more restrictive and intrusive but that
is a whole nother thread for a different newsgroup. I respect people
for who they are, not where they are from. I am merely fortunate to
have been born into a place where a techno geek can get more goodies
for less money, afford to drive and even buy a car at age 16, and
travel thousands of miles without papers of any kind. I want the best
for everyone. I especially am impressed with some of the demo coding
done over in Europe. Seems to be on average better than demos from
the U.S. I know there are clever people all over the world. I don't
know why I have it so good and others maybe don't (or maybe do,
depending on perspective).

>If a commodity is dirt cheap in any area then you can expect to see it
>used widely. I remember from my trip to the Greek island of Paros

So why are things so expensive there?

>>Most .com addresses are from the U.S. While Atari

>Yes, but they're increasingly been used by businesses from outside the

Yeah, I love the 1st ammendment here. You have to tolerate some of
what you don't like to get to have what you do like sometimes.

>graphics-wise the 8 bit Atari's ruled. If they had a sound chip
>comparable to the SID then they would have rocked!

Yeah the SID was a great chip for the time. Also the 64 had better
sprites and also had 16 color text. Kind of looked like 40 column
ANSI. But over-all I still prefered the Atari8. Stuff like SpartaDOS
and that I thought made it much more useful.

Cheers,

Jon

Sure. Want it for DOS or Windows9x?

My faves:
Atari800Win for Win9x
Atari800 for DOS
XL-it! for DOS

Sorry don't have url's handy at the moment but I'm sure others will fill you in. If not, reply back in here or email and I will dig them up for you.

Cheers,

Jon

This message is for all Atari XL/XE 8-Bit computer users. We currently have a limited quantity of European software games on 5.25 floppy disk available for immediate shipment. Our supply is limited, and will be sold on a first come first served basis. Since we no longer deal with our European supplier, we simply wish to sell the remaining inventory of the games we have left in stock. Once it is sold out it is gone for good! So if you are looking for something new, fun, and with quality graphics for your Atari 8-Bit computer, the time to act is now while we still have these games in stock. The game titles and prices are as follows:

Robbo.....
.....$
9.00
Lasermania and Robbo Construction Set (2 games on one
disk).....$14.00
Mission Shark and Fred (the Caveman) (2 games on one
disk).....$14.00
Dagobar.....
.....$
9.00
Change.....
.....$
7.00

New Jersey residents must include 6% sales tax.
Please add $1.75 for shipping and handling for your total order (small or large).

Print & complete the order form below and send your order with payment by Personal Check, Bank Check, Money Order, or Postal Money Order in US funds only made payable to:
ZTM Software Mfrs.

> There two newsgroups but with the same exact name? Explain,

No... it's just that you assumed that the 'a' was short for Atari; Richard
Fairhurst assumed that you'd realise that he'd used it to mean Amstrad. I do
the same with "csa.misc" - without sufficient context, you'd probably assume
that I'm talking about a newsgroup with which you are familiar. Add that
context and it becomes obvious whether I mean Acorn or Amiga - or, for that
matter, Atari.

3938. $$$ for Omnitrend's Universe DOCS

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-07 00:00:00 UTC
From: smeans@unm.edu
Message-ID: <smeans-0711982100070001@192.0.2.1>
Source record: 58466

Hello,

I recently obtained Omnitrend's Universe, but the fellow that sent me
disks didn't have the DOCS! Uh, does ANYONE have documentation they would
be willing to SELL or let me PAY them to copy? SHEESH!

For that matter, if someone has a copy AND the manual, I have cash in hand!

Ok, and here's the last stab I'll take: does anyone know of a source to
obtain manuals? Mebbe I could try that too!

At any rate...back to figuring out how to navigate in Omnitrend's Universe
without the DOCS!

thanks! (a bit frustrated at the moment... ;)

I myself was not one of his victom's but what he has done is ludicrous.

At this point I say get the source code out so that we can keep our 8-bit computing alive, and if he want's to dispute ownership - let him come out of hiding. There are plenty of people waiting to welcome him back.......

Sounds like the contacts on the various cartridges may be dirty. Try removing the memory & OS carts and cleaning the edge connectors. Then reassemble and see what happens. You might want to insert/remove the carts several times to clean the slots too.

Good Luck!

>posters are from Europe: the biggest group of them are from Britain.

There are more internet users in the U.S. than in the rest of the
world COMBINED. Most .com addresses are from the U.S. While Atari
sold a lot of machines in Europe (and I'm glad they did), do not
forget that they sold a butt load of them in the U.S. as well. There
are Atarians all over the globe not the least of which are from the
U.S. Now then, none of that conclusively proves anything in regards
to c.s.a.8 readership, but then your assertions are equally unproven.
In light of the fact that neither notion is proven; it stands to
reason from the facts that are known that most of the posters would
have a higher probability of being from the U.S.

I want to say that it does not matter to me of course. It just rubbed
me for some reason when it was stated that "the majority of c.s.a.8
posters are from the U.K." That quote was paraphrased but that is the
essential statement that was conveyd. The statement left no room for
doubt that was an undeniable fact the way it was written.

Just for the hell of it, let's have a poll of the participants in
here. You Atarians reading this just drop a reply and state where in
the world you reside. That will take the guess work out and settle
the matter. I'll start.

3944. repost: TAF Atari Flea Market

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-07 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3643d49c.0@nemo.idirect.com>
Source record: 58582
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari,comp.sys.atari.8bit

sorry for the repost, some pertinent info was cut out.....

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto
Atari Federation FLEA MARKET! The doors open to the
public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned
hardware and software where you may find that peripheral, application or
utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your
XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any
use for, get yourself a half-table and try to sell it! Or find that
treasure that you have always wanted. Great deals should be in
abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each.
Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member
family but if you are selling and have taken a half-table or more,
admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing
for sellors after 6:30 PM, and teardown after 10:30 PM. This should
allow enough time for as many people inside and outside Toronto to
attend the event.

As usual, piracy cannot and will not be condoned. You must be selling
original pre-owned software only. If anyone is caught selling pirated
software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room"
of the North York Memorial Community Hall on the Lower or Concourse
Level of the North York City Centre Library Building at 5110 Yonge
Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5
stoplights North of Hwy 401 running East off of Yonge

Hello,

Does anybody know how many box styles there are for the Atari 8-bit version of Pac-Man?
I recently found the game with the typical Warner 400/800 box (big format), but the artwork is unfamiliar to me.
In this variation, you don't see the maze from the top, but Pac-Man (wearing a green T-shirt!) being chased by the ghosts in a castle.
The manual is also a bit different.
Does this box style seem uncommon to you?

Thanks,
Bertrand M. (LEXX)

No but there is:

comp.sys.amstrad.8bit
^^^^^^^

comp.sys.atari.8bit
^^^^^

Hence the confusion when abbreviated to csa8.

For the record, my original comment about most csa8 readers being from the
uk referred to the amstrad group, which should have been obvious from the
rest of the post. I hadn't realised the atari group had been added,
otherwise I'd have been clearer.

I guess I wasn't as clear as I might have been, judging by the email I've
received on this post. I didn't necessarily want to sell the keyring. I
was just curious about its history and current value, that's all.

I'd better take better care of it, considering what I just read. I have it
in the bottom of a catch-all dresser drawer. Interesting. My Mom
originally found it in the bottom of a $1 garage sale "wonder box" (you
wonder why you bought it) she picked up for something else in it...

3967. Terminal software for Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-08 00:00:00 UTC
From: chess@glib.com
Message-ID: <36468d16.23992376@news.interport.net>
Source record: 58485

I need to move my old files from my Atari 8-bit system to a PC. In the past the only way I've found to do this reliably has been by running terminal software and using a null modem. Both the Atari and the PC are faked into thinking they're using a modem and are on line. But my Atari terminal software has a maximum speed of 2400 baud. I know that the Atari 800XL could go up to 9600 baud through its RS-232 connection. Does anyone know where I can D/L an old terminal program that will handle 9600 baud?

http://www.glib.com/

3968. Welcome to comp.sys.atari.8bit!

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

3971. ATR-8000

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-08 00:00:00 UTC
From: smile4@voicenet.com
Message-ID: <Qoj12.211$%X2.961695@news3.voicenet.com>
Source record: 58489

Awhile back I asked about running a 3 1/2" disk drive (750k or 1.44mb) out of an ATR-8000 fully loaded with the co-power 88 (Intel 8088 CPU) running MS-DOS 2.0 on a 256k 800 XL...

I'm going to try it on...I'll keep bumping up the MS-DOS versions until it works...

Are there any ideas as to whether this will work or not?

thanks, John

> Doesn't that make border emulation a problem? Or can you do nice
> Amiga-esque things with the border?

Setting the border colour is easy. Timing the border colour changes (eg. via interrupts) is impractical; generation of the interrupts aside, you can't be sure that somebody won't mess up the timings by tweaking the mode for their monitor.

Emulating the Spectrum border by using a larger screen area, say 288x312, with exact timings (for games such as Aquaplane, the 'bars' effect on the Mindtrap title screen, and of course tape loading) is possible; however, Z80Em currently doesn't do this.

BTW, here's the mode definition:

```
# 256 x 192 (101 Hz)
startmode
mode_name:
x_res:256
y_res:192
pixel_rate:10000
h_timings:36,40,16,256,38,14
v_timings:3,19,16,192,16,2
sync_pol:0
endmode
```

(The h and v timings give sync width, back porch, left/top border, display, ritght/bottom border, front porch. Hmm, the v timings add up to 312...)

He is not HIDING!, just wants to be left alone until he feels his projects can be completed! As far as Litigation is concerned anyone can file suit against anyone at anytime, reguires a Lawyer and the legal process.

I can sue you in your state for nothing provided I can present a case no one wants to do this because it costs them out of pocket money. Money talks as the old saying goes B.S walks! Now if you have a $100.00 item and it is going to cost you $2,000.00 and time and to recoup $100.00 where are you going to go? Complain on the internet! See it is much cheaper to do this than pursue the actual costs legaly.

You are close, late 20's to ealry 30's. Still he did something none of
us had the ba..s to do, he whiped ICD, into selling all to him. I give
him credit for that, I called Tom Hawker, and his price was outragious!
So
unless one wants to meet an outragious price for a dieninn market, he
either has to have a gerater vision or confidence in the market than I
or many others had at the time!

According to Federal Law you own nothing! Now you say he has screwed you did you receive a jar of Vaseline and enjoy it? Blatant statements like yours leaves one to wonder? What did he take money from you for and did not produce?

As far as Sparta Dos is concerned we (you/I) have a problem here as I have paid to have it re-written, corrected ect, and as to what version you are laying claim to will actually contest your rights, as I own what I have paid for and have legal papers in line for what I state. Where is your legal status?

Like I have stated before money talks bull shit walks!

Mike Homan, is infact an honorable man. Has treated me fairly in dealings, I in return have with Items I received from him personally have sent out what I have to those he owed, when possible. When you life goes down the shitter, I sincerely hope someone will pick up the pieces and help you out of your situation!

Ok, you were not one of his so called victems. I have seen many posts on this are that states I was screwed by Mike Hohman, FTE. Well lets get to the actual facts.

1. What did he accept money for that he did not produce?

2. How did you pay for it? Credit card, Cash, Check, Money Order?

Now to respond to your post. Who the hell are you to come up with this crap? He has spemt over $30,000.00 of his own money to come up with Software Rights, hardware rights no one else would put out for the product. Myself included, I talked to Tom Hawker of ICD reguarding the pricing of what they were selling. If I had put out that much money for a diening product, I would personally come over to your palce and give you a bill for your attitude!

Atari 8-Bit users is one of the toughest markets to approach. No one wants to spend more than $2.00 for anything they think they can get for nothing. This is why no one will pay programers for new products or support the group.

I like Mike have spent thousands of dollars in your behalf. You sir do not give a shit so why should we? I appologise for taking this out on you but your post opend up a sore spot! You and your type are the reason that you/they have no support today, and one of the reasons I am selling off my Rights!..What somone else does with them is their business. Now I will continue to help/repair Atari 8-bit computers, disk drives ect but if you are in need of this service, the rate is standard IBM table rate $120.00 per hour or fraction there of plus parts.

Those of you that read this and understand the content, my rates to you will not change. I support those that have in the past and future support us as a Group!

Bob Klaas

An old programmers tool.

Does anyone have a copy of Ultra Dissembler by Ralph Jones, it was distributed by Adventure International in the 80's for the 800 series.

It could dissemble a file from disk to memory and otherwise helpful stuff.

Well, it's obvious from your posts that you are an ignorant asshole!

Maybe you don't understand english (as I can see from your responses), but what part of taking money without sending product, don't you understand? Mike must be hiding at your place and blowing you every night for you to stick up for him like this.

Let me phrase this in simple English so even a moron like you can understand:

MIKE HOHMAN IS A CROOK!

Why he stole money and merchandise from myself and others is a mystery to us all. Since you seem to be his representative, maybe you can get us some answers.

If you've paid for Sparta, you're a bigger idiot than I thought. Did you license it from Mike? If so, that means you know his whereabouts. Which means you approve of what he's done. Which means you're a scumbag too!

As far as I'm concerned, I and everyone else who got screwed by Mike, own the rights to Sparta and all the other crap he got. How about sending us all a few bucks to license it from us?

Screw Federal Law and your legal status bullshit. You've done no favors for me as you state in your next message. If bullshit walks, then walk the fuck out of here and take Mike with you!

I thought I'd attempt to make a simple game on my 800XL. So far I have a small program that continuously checks the joystick port, then moves a player accordingly. The thing is, I tap the controller and the player flies across the screen several times before the frame is even done. I want to make it wait for the next frame before it checks the port again. So how do I do it? If it has anything to do with interupts I'll need help with that too as I don't know how they work.

thanks in advance
DamageX

This message is for all Atari XL/XE 8-Bit computer users. We currently have a limited quantity of European software games on 5.25 floppy disk available for immediate shipment. Our supply is limited, and will be sold on a first come first served basis. Since we no longer deal with our European supplier, we simply wish to sell the remaining inventory of the games we have left in stock.
Once it is sold out it is gone for good! So if you are looking for something new, fun, and with quality graphics for your Atari 8-Bit computer, the time to act is now while we still have these games in stock. The game titles and prices are as follows:

Robbo.....$

9.00
Lasermania and Robbo Construction Set (2 games on one disk).....$14.00
Mission Shark and Fred (the Caveman) (2 games on one disk).....$14.00

Dagobar.....$

9.00

Change.....$

7.00

New Jersey residents must include 6% sales tax.
Please add $1.75 for shipping and handling for your total order (small or large).

Print & complete the order form below and send your order with payment by Personal Check, Bank Check, Money Order, or Postal Money Order in US funds only
made payable to:
ZTM Software Mfrs.
PO Box 240

Robert Parratt:
> Are there any "parties" in England? If not, why bloody not!?

Nobody has *organised* any. There might be an "event" (read: one guy
near Brum has a very large house and an ISDN2e line) somewhere around
Feb. 99 (for which our demo "Bandwidth" might even be finished) but that
is C64 only. Even the majority good Euro events only seem to have C64
support for the 8bit side of things, X'98 was C64 only this year and
more popular than *ever* before...

Oh, no offence Robert, but could you quote a section of the post(s)
you're following up to, this one was easy to follow but the others
you've made are not always as simple to slot into the conversation...

I always thought the Austin 80 plug into one of the card slots of the 800
also. But I
could be wrong.

Bob Woolley mention on an Atari 8bit email group about a chip # 6245 (I
believe). Bob
if your reading this, who makes that chip?

I also email Mr Mathy van Nisselroy about the signal he was looking for. I
saw something
on the schematic for the 800XL on pin 46 of the parallel bus. It's labeled
LR/W, could very
well be the Late R/W he's looking for. I also looked on the 130XE, didn't
see it there since
the 130XE uses a Freddie chip for the memory timing and such. But the LR/W
on the 800XL
also goes to the memory WRT line for the 64k ram chips. The same signal
coming out of
pin 34 on the Freddie could be the same in the 800XL thats coming out of
the delay line
and associated gates.

If it is a hardware issue, would it be possible to set the R-Time 8 back to, say, 1996, and modify the software to automatically add 4 years? The R-Time 8 is useful because it provides a constant clock, but nobody says that SpartaDOS--or any other program--needs to read the data unparsed from the R-Time 8.

I have no problem with Mr Hohman but have read many posts from people who say they have been "ripped off". I can't say if this is the case or not but if true I think they might find your statement that he is an Honourable man based on the fact he didn't stiff you as being slightly insulting to them.

I know I would..

Perhaps a thought should be spared for those whose hard earned cash seems to have gone missing.

Anyway Bob, its not a dig at you, from what I have seen over the years in this group you are a rock solid Atari person who would help anyone out.

Good on you kind sir!

-)Follow the money. Think it over. Answer the question.

Well in England, I believe that BT is not allowed to reduce its prices because it would be unfair to all the other little phone companies that exist, this is a rule imposed by the government watchdog. That is why we have silly things like Friends and Family (10% of calls to 10 numbers) with a favourite friend (a further 10% off calls). Obviously, you make your ISP your favourite friend, but it can still cost 50p an hour at the weekend, and a lot more during the week. I think, I don't use the phone much.

As for the other things, that is because companies can get away with rigging the prices high in England, because no-one complains here and the law can't really deal with it well. Also more tax. Just an economy of scale - less people to pay the tax, more revenues to be raised or something strange. Also a welfare state of sorts, so the poor people don't end up as an underclass too much, like in America. Luckily things are being optimised quite a bit over here now...

England is great: low wages, high tax, high commodities, high prices.

Luckily I am at university. I have a fast network, but everything else costs still.

You get free local phone calls in England with cable, but that doesn't seem to be very pervasive - Satellite TV has won the TV war over here for those willing to pay for more channels.

Graham

Not true. The governing company that monitors telephone activity (Whose
name eludes me) has stated that they have no problem with BT offering
free calls at all.

I don't have much experience with them, but I beleive you would increment a counter during the vertical blank interrupt. This counter is checked in you main loop. When the counter reaches a specified value (higher value moves object slower, lower value moves object faster) you reset the counter then check the joystick and move the object if necessary. Thats the method I used (and probably many others) on a DOS machine. If I get some time I will give this a shot.

later,
eparent

11-08-1998 Announcement:

The Atari Historical Society is proud to annouce the recovery and presentation of one of Atari "Lost" projects: The Atari 3200 "System X".

This is the fabled Super-Stella (aka Sylvia), the 10-bit video game console Atari was designing to replace the Atari 2600. However the project was cancelled and replaced with Atari's next System X: the Atari 5200.

Currently 2 photo's have been placed onto our site, additional photo's will follow within the next several days along with an unbelievable photo of a SECOND Atari holographic video game console called "Spector" which would have used very similar technology as the Cosmos holoptic game system.

More to follow...

I've never dealt with him or FTe myself - but I've seen at least a years worth of "What the #%@& happened to FTe?" messages in this group. Far be it from me to make assumptions, but I expect I'll wait & see before I send FTe any money. Until I know the *real* story. Can/will *anyone* tell the real story?

> direct all flames to:
> jhardie@pipeline.com

It won't be me, but I imagine the word 'Incoming!' fits this line.

I expect that *some* of these 'people' would not make quite as much racket whenever his name is mentioned, if they actually *knew* what the hell happened to the "poor bastard".

I don't expect *all* of 'em are heartless, money-grubbing peckerheads - although there are always a few in every crowd.

Although you gotta admit, anyone who is still playing with these things, and willing to invest cash money in items *for* 'em, has to be reasonably dedicated to the platform.

Howzabout everyone puts it back in their pants for awhile, and get this guy to write a un-traceable message (to be posted here) describing what happened, and what he wants to do about it.

Am I right in assuming that this concept will piss off *everybody*, and
start another religious flame-war?

There are only two TEENSY little problems with your argument.

1) Most csa8ers have told csa8 where they're from.
2) Richard has met most of them in the real world.

In addition, would it not be more sensible to look at Amstrad sales as
opposed to Atari sales when looking at an Amstrad newsgroup? Duh.

It could also be asked "What the fuck have Amstrad got to do with c.s.a.8?".

This stuff is being cross posted across 5 news groups, two of which share
the initials c.s.a.8. One Atari, the other Amstrad. Simple. Perhaps it's a
good thing there isn't an 8bit Acorn group;-)

Most of the postings on c.s.amstrad.8 are from Brits. Most of the
postings on c.s.atari.8 are from the US.

>that needs that signal?

I don't have it yet. But I've seen the schematics of the Austin 80 cartridge.
And it needs RW-LATE (according to the schematics). The Austin 80 cartridge
was/is an 80 columns cartridge which could use 16 colors (a mix of red, green,
blue and intensity. ONE bit per "color").

>was/is an 80 columns cartridge

The Austin 80 was a cartrdge??? Hmmm I thought that went into one of the slots on the 800.... as the Bit3 board did..... might be a better choice to get Omniview... there was an 80 column version for XL.. and patches were made for that to work with some of the more recent software.... I cannot remember anythint that worked with the Austin.. hmm.. maybe Letter/Data Perfect....

4021. Joystickfire 2 in Win800

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-09 00:00:00 UTC
From: Christian Tachezi <tacho@telekabel.at>
Message-ID: <3646f2dc.0@news.telekabel.at>
Source record: 58526

Does anybody know if the joystick 2 is working correctly in the win800
emulator.
The stick itself works, but if i use the fire button, the emulator seems to
recognize it as the F9 button on the keyboard, which causes the pause. So
whenever you want to fire with stick 2, the emulation stands.
Any help?
Thanx in advance,
Chris :-)

Hey guys!

I have been out and I am out of all subjects, but I have seen that You were discussing about copy parties. As I know all parties in Europe and USA are very nice and I wish I could see them for real, but there is only one copy party where You can still see some fresh and juicy software made for 8-bit and not only - it is Polish QuaST Party. I don't write it because I am polish, but You (all of You) should come next year and see it! Probably it would be the last real copy party where You can meet still active demo coders and good programmers at work!
I am writting about it now to help You find some free time next for this occasion.
This year was International QuaST Party - first one and the last one.... not the best one I guess...
Anyway, this would be the last place where You could see soew demos. I feel, that next Year would be the last year for 8-bit demos.... Don't expect any more, because Polish programmers have to start earning money... That's very pesimistic vision of the future, I know that, but that could be unfortunately truth.

See You...

Alex

That is a great find Curt! Excellent stock photo's too. Where did you
find them,
the Sunnyvale dump? he he he... just kidding.

I'm looking forward to seeing the schematics (if you got them?). What kind
of processor
was a 10 bit processor. Working with a 10 bit processors sounds difficult
enough.
Is that the reason why the programmers didn't like it?

And the 5200 Laserdisk....you gotta get something up on that! I'm dying to
find out.

C'mon Bob. He's not hiding? He reads this group but he's not hiding?
It would seem to me that he is very much hiding SO that he is LEFT
ALONE.

>As far as Litigation is concerned anyone can
>file suit against anyone at anytime, reguires a Lawyer and the legal
>process.

Ah yes, were you assuming that this was unknown before?

>I can sue you in your state for nothing provided I can present a case.

No actually you can't sue for nothing. Like you say you must be able
to bring a credible case before the court. But if you mean what some
construe today as credible really amounts to nothing sometimes, then
yeah I can agree with you.

>No one wants to do this because it costs them out of pocket money. Money
>talks as the old saying goes B.S walks! Now if you have a $100.00 item
>and it is going to cost you $2,000.00 and time and to recoup $100.00
>where are you going to go? Complain on the internet! See it is much
>cheaper to do this than pursue the actual costs legaly.

That's a good point but.... when you have a situation where there is a
business entity which defrauds multiple customers there can sometimes
take place what is called a class action suit. One suit on behalf of
all or many of the victims combined. This obviously greatly reduces
the individual cost and effort to per sue a case.

In any event I want to make it clear that I personally have no issue
with Mike. I was never ripped off no do I know of anyone personally
who was (other than some posting in here about it). I like to see
innovative products for the 8-bit Atari. I just don't like to see
peoples hopes raised, money taken, and nothing delivered.

> I have a 130XE and XF551 and 56K modem connected to my 850.
> What software can I use for web browsing and email?
> What Uk servers can I use?

There's nothing that will allow you to web browse directly from your Atari 8-bit yet. But what you can do is find an ISP that has shell accounts. You then dial into you shell account on your ISP's computer, and use a terminal program (like ICET, flickerterm 80, BobTerm, DeTerm, etc.) to browse the web, read mail, read newsgroups, and more using the software on the ISP's computer. All the software you need for your Atari can be found at the umich archive (and mirrors). Or if you don't have any way of downloading files to your Atari, you can find some programs that will get you started in the Page 6 Public Domain Library.

You may want to ring up different service providers here in the UK to see what accounts they have available. You want to make sure it is a shell account and not a PPP/SLIP account. I have a shell account with The Direct Connection, that lets me log in with my Atari 8-bit, they have a lo-call phone number (0845 079 8200) so you get charged local rates from anywhere in the country. They also have a demo login that lets you have a look around (and make sure your equipment works) without parting with any money first. There are probably one or two other ISP's which offer similar services, so it might be worth hunting around. When I'm at home I use that account to read my e-mail, browse the web (with lynx - a text based web browser), read c.s.a.8 and more.

I guess you didn't understand the full idea of the question. That's
kind of like someone asking why a race car is so fast and being
answered "because it goes 230mph." So let me refrase my question to
you. Why are calls and other things so expensive there? Why are
things not done in such a way that they do not have to be expensive?
Follow the money. Think it over. Answer the question.

I guess so, David. Your links all say they're to: http://where?

This automatically leaves one at www.where.com in most browsers, which
has nothing to do with Atari 8-bit stuff.

Some of your images aren't there, either.

Your information was good though.

Startling fact no.1 : The USA spends more of it's GDP on healthcare than
the UK by a factor of 50% or so, and in the USA you still have to spend
a fortune on medical insurance. Weird.

Yeah, but I was talking all taxes put together. (40%-50% of wages go back to the government one way or another)

Also, in Europe workers tend to get paid more than in Britain, and goods are cheaper (What is £12,000 in England (e.g. Car) will be £7-10,000 in Germany, and the difference is not tax).

Also in Britain more people are taking up the insurance options because they are better than the state ones. But they get no choice as to whether they get to stop paying National Insurance, whether or not it benefits them.

And I have no interest in Economics as a subject either... :-)

Anyway, this has nothing to do with 8-bit computers of any kind. Except that computers have always cost a lot more in England than in the US, because of an import of technology tax that is ridiculously high.

Graham

It's even more than that: 16% compared to 6.8% (1997 figures, recent Health
Department pamphlet).

And 40% of the population are not ensured.

Yes. There are three standard modes on the CPC. There are 102 standard
modes on the VIDC1-equipped Acorns, and the newer VIDC20 machines don't
have a concept of a 'standard mode'. (Though admittedly not all of the
102 standard modes will be available to any one machine.)

> Which can all be in MODE 0,1,2 or 3

All the VIDC's modes are bitmapped. There are more things you can do than
you can shake a stick at, though to do a lot of the really, really clever
ones you have to count cycles, which means it breaks on the faster machines.

Though of course there's always the IOC counter 2, with its 2MHz count.
You can do pretty accurately timed stuff with that.

> And thats before you start changing the number of scanlines in a character,
> or the physical position of the screen.

Nice point, but you to let you futhur understand my position I'll explain.

I am not an Atari developer, but have been an Atari user since 1982. I have

been active user on & off ever since. At the time that Mike bought the
rights
that he has I was excited to see some fresh air breathed into the 8-bit
community.

However, at the time I was interested in purchasing stuff from him but was
financially restricted for personal reasons. Shortly later I started seeing
the postings
from people who had sent him money for products and never recieved anything.

From my perspective what I see is someone with multiple business complaint
about him and who has for all essence killed development on a large number
of products. If it's true that he is working on them, then great. If not,
then he
should sell those rights to someone willing to continue development.

My previous post may have been a little extreme but since you are the only
person
who has come forth that has had any contact with him it looks to any
layperson
that he is in fact hiding. I do support "the group", but from my
perpspective,
Mike does not support it.

Not really; that spend is by individuals and companies, not the state.
People often think it means that the state and national governments
spend 50% of its GDP. They don't.

So the per capita cost of doing it their way is about 3 times the cost
of doing it our way. Say no more. :-(

You could put it there, but it would seem more effecient to only check the joystick when its time to move the object. For simple games I suppose it would not matter. It just seems like your wasting cycles checking the joystick on every interrupt if you are not using the value returned.

I have lost vikings for the genesis :)

Somebody mentioned a title called robot knights on the atari. That sounds
familiar. Anybody have it?

Mark

Threads always start somewhere!

This subthread started with a comparison of telephone calls cost in the
UK and elsewhere, moved into a comparison of different countries'
economic systems, then their taxation and health care policies.

Simple, really, especially with a newsreader which gives a graphical
display of the whole thread structure. ;-)

Hello,

I'm looking for packaged copies of Sirius' graphical adventure games for the Atari 400/800, released in 1982-1983:

Kabul Spy
Gruds in Space
Critical Mass
Escape from Rungistan

Don't know if Kabul Spy and Rungistan actually ever made it to the Atari, but it's worth a shot.

They can be in any condition, but preferrably Rungistan in excellent condition, as it's an upgrade for my mess.

I'm willing to pay a reasonable price, but please don't ask me to make an offer.

Cheers,
Rod
(lordmanc@aol.com)

4068. Character disks and such

Ok, I now have the emulator, and some of the software that I own, but I do have a slight dilemma. In games such as Wizards Crown and Alternate Reality, you need to create disks or have a character disk to save on. Is there any way to go about doing this or am I basically up the creek?

Yeah, I have that program going now, it's great to be able to see the game again, and hear the music. Even went back over to my parents house and dug up the maps, my wife thinks I'm nuts. The only problem I have no is trying to figure out how to save a character...This is gonna cut down on new game spending that's for sure :)

My wife *knows* Im nuts already so I'm safe :)

> The only problem I have no is trying to
>figure out how to save a character...This is gonna cut down on new game
>spending that's for sure :)

Most of the sites from memory had a save game disk as part of the set?

If not then I personally use a program called Ape by Steven Tucker to
create a blank atr. From there I either use DOS or if the program you
are using formats disk then I use that.

Ape can be found here http://www.nacs.net/~classics/

(Its very much more than a atr maker, have a read of the docs :)

Basically, treat the emu like you would a real Atari, the only
difference is that you swap disks via a mouse click or a key press
rather than have real 5 1/4 media.

So you can boot DOS 2.5, format a disk in D2: then write dos files etc
etc all like you would have done.

Have fun and if you get stuck either give the group a msg or drop me a
mail...

Are you sure its not an ST? When the Atari ST crashes it puts bombs on the screen. The bomb was a character in its font. The number of bombs is like an error number. Unfortunately I am not aware of virus detecting or removing software for ST or 8-bits.

Ok, I feel incredibly stupid. Having been on the internet in one capacity or another for many years(member of the Cleveland Free Net for a LONG time), I just now discoverd this base as well as the old 2600 VCS base. I was stunned to find an emulator for the 2600 and even more stunned to be actually playing Adventure again. :) Then I thought, maybe there is something similar out there for the 8-bit. Well, apparently so, but it's tough to track. A few of the links in the FAQ are faulty, and it's gotten to be a little frustrating at times. So, I need to know this, what emulators are there for the 8-bit and how about software? For the 2600 you needed to own the original cartridges to download the ROM's which I have no problem with, but at the current moment all my 8-bit software is God knows where at a former friends house which is in the same location since I have no idea where he now lives. :) I'd give anything to be able to just boot up and listen to the music from Alternate Reality again...

OFTEL, and they aren't a company.

>has stated that they have no problem with BT offering free calls at all.

They may have said that in the past (I doubt it though, please provide
a reference, as LOTS of people WANT to hear them say this) but what
matters is their CURRENT stance, which is that BT can't reduce prices.

Howdy Bob

Ever since the first time he bought rights I wondered if this guy had a rich family or something. He must be crazy (in the good sense of the word) to spend this kind a money on the Atari 8 bit.

What he DID do wrong - from my point of view - is that he disappeared into thin area. Now we hear you know him. You haven't shot him or kidnapped him - and knowing you a wee bit - this guy can't be all bad. His had a major bummer. Heck, why didn't anybody tell us before. Not all of us are narrow minded!

Source record: 58436

Howdy folks

A pal of mine wants to build himself an external memory upgrade. Problem is, how do we control it. He suggested $D600, but that's where the BlackBox resides. Anybody have any ideas on this? How those the MIO control it's memory. Is it compatible to internal memory upgrades? (I have a 1MB SIMM in my XE, would the MIO block that out).

CU Mathy Van Nisselroy

PS the SIMM upgrade seems to work fine. Just have to do some more testing. After that 16MB shouldn't be a problem. (finding 30 pin SIMMs this big, or 4MB for a reasonable price, could a another story)

SyQuest mostly is flopping because the ZIP, JAZ, and ZIP+ seem to be
more popular even though they aren't as good (does Apple II come to mind
when I say this?).

Laters,

>I thought it did do the sector skew with sparta dos?

I'll try, but I don't think so. I have a US
operating system that formats everything in
Ultra Skew on Doubler, etc. drives, but won't on the 1050 Happy. It would
work, I guess to
format a blank "master" on a Doubler and then
copy the disk on the Happy, but that takes a
long time, especially with disk swapping.

I think that USD compatibility and skew only came out in the latest
Happy for the 1050. Happy originally came out on the 810, and was used
mainly to copy protected diskettes.

I have had a problem replying via my Netscape Browser.

Thank you for our kind words. I am sorry I got up set at another individually post. Mike told me months ago he had problems, and that he would re-appear at an approve time. He said he was working on some new Items for the 8-bit community. If one is pressured one can not produce.

I have had several items that were promised to me 3 years ago for non vapor ware. But as we all see that is beyond the capabilities of the Owners of a Copyright or Hardware Right.

Bob Woolley put out plans in an old SLCC journal for installing a 256k SIMM in an 800xl or 1200xl; it only takes a few more control lines for 1 Meg. Better still, install a set of sockets - then it's 1 MB with 4x256, 4 MB with 4x1, or 16 MB with 4x4! (and that's even more fun with an '816, if you can hack it)

Looks like Syquest is going chapter11. Their website is no longer functional, and I'm screwed as far as getting term. resistors.

Anybody have a part number? Maybe Radio Shack (ha!) or some other place can give me a substitute part!

Need this component to get my 8bit (576k XE) back in business on my black box. These 44mb Syquests dont compare next to this 135mb sitting here!

Sounds suspiciously like a Mac, not an Atari..

>it can copy most copy protected disk based games..

But it has a couple of weaknesses, though.
One is that it cannot format with ultra skew
(and it doesn't need it, but other drives may.)
There was a program at one time that
would allow the Happy to format in ultra
skew. Anybody know how to do it? I've written to the author/seller asking
about
purchasing it, but have not received any response. Okay, someone will say "use
a Doubler or Super Archiver or Ultra Speed
XF551 to format the disks." That is an
alternative, but I'd like the Happy to be
really Happy!

Ok The happy drive first of all was a double density drive like the US
doubler mod. It was also capable of doing the ultra speed sector skew for
fast loading. and the best feature of the happy was the ability to duplicate
disk based copy protection. Back in the day it was the only way to copy
protected disks. Sure there was chipmonk but that was just a crack database
with a few hundred programs in it :) Now there is the APE pro system that
will copy the originals just like a happy. BTW I had my first happy in 87.
Ahh memories :)

I believe you need to use MS-DOS 3.2 or higher to use 720k 3.5"
drives. 3.5" 1.44MB support was not added until MS-DOS 3.3.

You will probably need to use a different floppy disk controller to
write HD disks in either format (3.5" or 5.25"). HD floppies require
a higher frequency signal, IIRC. That also why an ST Can't write to a
HD floppy without changing out the controller chip.

Doesn't sound like a virus problem. Try to hold the machine (which is a ST or sorts, no bombs in XL's) on both sides and bend it. That usually moves something inside and it starts again. Most common problem with the older ST's, which had nothing to hold the chips down and they loosened up.

Try it, it worked wonders with my old ST's and recently on a friends.

:> And you think we don't on a CPC?
:
:Yes. There are three standard modes on the CPC. There are 102 standard
:modes on the VIDC1-equipped Acorns, and the newer VIDC20 machines don't
:have a concept of a 'standard mode'. (Though admittedly not all of the
:102 standard modes will be available to any one machine.)

Depends on your definition of a mode. BASIC only supports three at fixed
sizes. I don't consider adjusting the CRTC registers to alter the screen
dimensions to be a hacked video mode since it was used by loads of CPC
software and doesn't rely on any software overheads.

:All the VIDC's modes are bitmapped. There are more things you can do than
:you can shake a stick at, though to do a lot of the really, really clever
:ones you have to count cycles, which means it breaks on the faster
machines.

All the Amstrads modes are bitmapped, but the screen dimensions are in terms
of 16*8 (@640*200) pixel blocks which is why I was using them.

Cycle counting effects can of course be used on the CPC also to create even
more effects, vertical/horizontal/diagonal rasters, hardware splitting,
VSYNCs and HSYNCs in the middle of a scanline, sprite multiplexing...

:> And thats before you start changing the number of scanlines in a
character,
:> or the physical position of the screen.
:>
:> Then you have the custom multimodes, hardware splitting...
:
:...changing VIDC registers halfway down a scanline...

I wasn't suggesting you couldn't do fancy tricks on an Acorn, it has a 6845
like the CPC so there are bound to be loads. The C64 and especially
Spectrums however have a much more limited range of video tricks.

I have the following atari items and might be pursuaded to sell them if anyone makes me an offer that it worth it - so i figured i would post it here and see what happens.

i have the following, all in working condition:

850 interface
percomm DD/DS Disk Drive
Indus GT Disk Drive
2 Atari 800's
1 Atari XE Game System
1 Atari 130 XE
Koala Pad
Joysticks, TV adapters and all power supplies included.

i also have a couple of boxes of games, utils, etc.. the ACTION! cart is included along with all software for the Indus.

I also have an atari 1040st with monitor and 170 meg hard drive if anyone is interested.

If you are interested, please mail me an offer to DOCTORX@DALLAS.NET

>
> Scotsman

Scotsman,
Easy one! Simply copy one of the ATR files to a new file (new name),
then from within the emulator, simply delete all file in the image. This
is essentially a formatted disk. Now, run the game and have that image
mounted as one of the drives. You may have to drop back to the emulator
properties mode to switch out the D1: image with you blank disk image
then go back into the game WITHOUT rebooting the emulator. Then save the
info. Hopefully this can be done by only having the blank image as D2:
instead. It depends on the game whether or not everything must be in
D1:.

Michael,
A Happy Enhanced drive is one that has the Happy Computers add-on
installed. It allows for very fast read/write opperation, special
backup copies of protected software, can make MS-DOS SSSD (or is that
SSDD (I forget at the moment)) readable floppies. There are some other
features as well. There is a copy of the Happy 7.1 manual at the Umich
Archive called HAPPYMAN.ARC. That will explain ALL of its capabilities.

If it prints bombs it is probably an Atari ST which has its own newsgroup
comp.sys.atari.st. try there for more help. I doubt it is a virus but it's
possible.

Hello there Stuart, nice to see you in here..possible article??

Well Jellystone went down but was mirrored at www.hackerz.com, the link
is still on the page but never seems to connect for me. Another mirror
is in Kent and its

http://aegis.mcs.kent.edu/~clisowsk/mirrors/8bit%3ayogis_site/ATR/

Knock it back a directory or 2 to get to see most but not all the Yogi
archive.

Yogi is still floating around in here... :)

I'm still testing it. But it seems to work OK. A pal of mine suggested we'd start collecting RAM TEST utilities. If anybody knows/has some, please tell me. (please don't just send them. Remember, I only need ONE copy of a utility :-)))

The Happy Drive is a re-vamped, cheaper, and claimed to be better than
the 1050 Atari Drive. This came about around 1985 (1986?) by Happy
Corp. (or something like that).

I've got links to both of the available Mac-based Atari Emulators on my
site along with other information you may find useful. Also, I read
emulation.net regularly, there is some kind of bug in Explorer. It
apparently requires some kind of patch which may or may not be available,
depending on whether you use the AOL version or the stand-alone version.
Have you tried using Netscape? Works fine.

4135. Star Trek A La Temple U

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-13 00:00:00 UTC
From: chess@glib.com
Message-ID: <364dcc7b.47286168@news.interport.net>
Source record: 58203

Years ago I came across a game called "Star Trek A La Temple U." It was written in BASIC and used ASCII graphics.

I'd like to know if anyone has made an .ATR file of this game or if maybe the author might have re-written the game for the PC or anything like that.

Of course hundreds of games called themselves "Star Trek" back in the old days. So here are some of the things I remember about the game: It appears that someone from Temple University wrote it, but their name doesn't appear anywhere in the game.

When you started the game you were asked how many Romulan vessels you expected to face. You input a number from 1 to 26, and that was how many enemy vessels you fought. You were a + sign in the center of the screen and the enemy vessels were each represented by a capital letter of the alphabet. You locked phasers and photon torpedoes and launched them.

I liked the game, apparently one of very few who did, and I'd like to try it on the PC. The only problem I had with it was that it involved a lot of number crunching and the Atari 800XL took an outrageous amount of time to crunch those members when you played more than about 15 enemy ships.

TIA for anyone who might be able to help me out on this one.

Howdy folks

Here's an idea for the Demo coders among us. I reently reread an old ATARI USER magazine (for the UK). They had this article in their ST section about a program showed a house (like a little girl's doll house, NO front) with a little guy in it on the screen. He'd play organ, read his paper, cook dinner and everything at random. A very early version of Tamagotchi if you like.

Wouldn't that be nice to have for the 8 bit ATARI? Since we only have 40 columns, the screen would have to scroll.

I like the idea, but I'm not a programme.

There was a program for the C64 called "Little Computer People" from
Activision. There was a Atari ST Version, too. Perhaps this was the
program you have seen in AU.

My Upgrade has the advantage that you don't loose separate ANTIC and CPU
banking. Nor that you switch of BASIC if you want to access it from a Bank
of extended memory. It seems SDX an do that.

Haven't tested my upgrade with Sparta yet. Don't have SDX. I do have 3.2f
and g

I am testing it with Rafael J. Espino's RAMdrive handler. (Well, not all the
fine features, just the basic RAMdisk stuff). Last night I tried it with
BobTerm. Man this RAMdrive handler is so fast, I had to heck if it had
really saved the capture buffer to RAMdisk. It did, all 4360 single density
sectors of it. (Yes, that's over half a megabyte)

From: TJ Edmister <Damage_X@hotmail.com>
Message-ID: <364CC9CD.6645@hotmail.com>
Source record: 58217

In programming my game I keep having problems where the OS is
continually seting certain hardware registers, but I don't want it to. I
suppose that all of these registers are mirrored somewhere around in
$200-$300. How do I find out where these regs are in there? Or is it
possible to disable the OS (hey that should free CPU power to) somehow?

thanks again
DamageX

Source record: 58220

To get the info you need, get Mapping the Atari and/or the Atari Technical Reference Manual (Or is it Technical User's Manual ... ?)

To override the OS there are two methods if my memory serves ... for those that are "shadowed" in RAM, just write to the shadow register (which I guess is what you're looking for ...) and the OS puts them to the hardware register.

The other is to put your hardware-writing routine into the VBI service routine, which is where the OS is doing its thing. You can replace the whole VBI, or put your routine at the end. (Someone said, "He who writes last, writes best.")

Does anyone have the software that came with the ATR8000? It came with CPM and some other utilities. Any help would be appreciated.

4155. Atari 130XE I need help!

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-13 00:00:00 UTC
From: mattc@sinistar.motispd.com
Message-ID: <72j4jp$8mv$1@sinistar.motispd.com>
Source record: 58223

I just got a Atari 130XE in the original box at a thrift store
for the swinging price of $9.95 I also picked up a Atari SC1224
monitor (for $9.95 as well).

My first issue is the 130XE did not come with the power supply.
So I need to know where I can get one (Best electronics?).

Second. I need to get some info on the monitor. Is it color?
RGB?

Third. I am now looking for a disk drive and any other expansion
items. The users manual states that any device (disk drive etc..)
that was used on the XL line can be used for the XE.

Lastly.. Can anyone suggest a web site that gives a good
description of the 130XE and any hardware that was released for
it?

Many thanks in advance..

Regards,

4158. TAF Flea Market - Update

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <364d1b43.0@nemo.idirect.com>
Source record: 58226
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari,comp.sys.atari.8bit

a little update to the TAF MonSTEr Flea Market on the 18th of this month....

Those on this forum in Canada who have been wondering about Mario Becroft's new PC Mouse Adaptor will have a chance to see this little gizmo in action at the Flea Market, as Ken Macdonald has brought in five of the little beasties which will be demonstrated. Three have already been earmarked as sold, and TAF is currently looking at putting in an order for more.

BTW, I got a chance to play with one of them at our exec meeting Wednsday and was very impressed - especially since it was attached to a Logitech 3-button mouse. The centre button was configured as a double-click, and was very quickly gotten used to. The Logitech is also very ergonomic and fit the contour of my hand real good. One other thing - Mario has designed the adaptor so that it plugs into the mouse port, then the cable runs under the machine so that the plug for the PC mouse can attach behind the computer - great idea!

anyway, details for the Flea Market follows.....

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing for sellors after 6:30 PM, and teardown after 10:30 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge

the original post to this asked if a 3.5 can be used on an atr-8000,
the answer is yes a 720k 3.5 will work just fine (i used it with spart 3.2
set as 80trk dbl sided dbl density) and i have about 25 720k floppies with
my atari stuff on them... i also have a 720k 5 1/4 floppy that works fine
also. i was asked by someone to rewrite the roms in it to emulate the indus gt
synchromesh high speed enhancement, he even had all the technical docs to do
it but alas, i dont know z80 assem :'(

sloopy.

Yes, it is. RGB color monitor for the ST range of computers. I think they
have composite connectors in there too, so it should perhaps be possible to
make a connector for the XE

Source record: 58231

It adds a track buffer to the 1050 in addition to the other stuff
mentioned. This enabled the drive to read an entire track in one rotation
of the diskette. The limiting factor became the slow serial drive
interface. Happy tried to help with this by patching DOS to allow the
drive to pass data at twice the rate of a standard 1050. I have three
happy 1050's still. Nothing beat the sound of the drives using Warp speed
with the track buffer.

The Atari 400/800 has an 8-bit processor and only addresses 64K of memory.
There is 16K of ROM that is its operating system, so 48K of RAM is all that is
available. The good news is that you are allready "maxed-out".

Sorry,
Pete

from Best or B&C at www.myatari.com

> I also picked up a Atari SC1224
> Second. I need to get some info on the monitor. Is it color?
> RGB?

the Atari SC1224 is a color monitor for use with Atari ST computers.
it requires a different signal than what the 8-bit outputs.

> Third. I am now looking for a disk drive and any other expansion
> items. The users manual states that any device (disk drive etc..)

nope. the SC1224 has no composite input. its only RGB. i beleive the
Amiga
monitors are the ones that have RGB and composite.

That was a fun game! I liked the Holy Hand Grenade and rabbit.. I figured out how to evade the rabbit and use the grenade to smash up the ship, making it easy to solve the final board. I can't find the disks now though.. too bad.

Source record: 58245

Hello,

I'm Tony Ramos. You may remember me from such software titles as 'Parrot' and 'Creepy Caverns'. ;-)

I'm in the process of sucking all of my physical 5-1/4" Atari disks, TRON-like, into the virtual ether of my PC's hard disk, thanks to Steven Tucker's fine APE system.

All disks, that is, except for my commercial disks. I don't have the Pro System, so I can't completely duplicate these. Ironicall, one of these disks is my own work!

So, can anyone out there provide me with Pro System images of the following titles? They're somewhat rare, so I am willing to send the disks out for conversion, if necessary. BTW I intend to share the images with the public once they're made.

Thanks,
Tony R.

JAM!! is a standalone adapter that allows you to hook up your Atari to a VGA monitor. For best results you must make your own cable, but it is worth it! The display on an 800 is superb.

It costs $79.95 and can be ordered at aimslab.com.

4184. Where have all those beaut BASIC programs gone?

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-15 00:00:00 UTC
From: Rohan Langley <rohan@spamout.pacific.net.sg>
Message-ID: <72mqh7lqu1@newton2.pacific.net.sg>
Source record: 58252

Sometimes I feel pangs of sadness to imagine the loss of many of those often simple, but nevertheless amazing and lovingly coded BASIC games and such for the 8-bit. Do you think many of these programs would be relegated to extinction? Checking all the Atari archives doesn't seem to reveal them in their simple glory and immense number...Seems only the stuff with mass-market appeal appears online...?

Particularly enjoyable were the programs that stretched the ability of the Atari, adding extra colours and animations with careful use of Player-Missile graphics and verticle interrupt trickery. Even today's pc's seem to lack the smooth as silk scroll of some of those Atari animations!

Someone prove me wrong! I hate to think that that huge archive of disks I thoughtlessly sold off over a decade ago now grows mould in someone's attic.

Rohan

Source record: 58253

>There is 16K of ROM that is its operating >system, so 48K of RAM is all that
>is available.

Perhaps not. The Mosaic 64 memory upgrade
(1982?) allowed the additional 16K Ram to be used as 4 X 4K ram banks that were

user selectable. The Mosaic 64 was originally
designed for the 400, so if one could find one and learn the magic... The
400/800 OS was only 12K, so there is 4K "left over".
For instance, if you have an XL/XE and
run a Translator, you can get 52K, with the
$C000-$CFFF (4K), although not
contiguous from BASIC. Probably the
easier and cheaper solution is to get an
XL or XE, though.

Pool Disk Too is one really good source of the programs. Both of my
user groups have copies of the first Pool Disk (it's in my posession for
one of the groups since I'm the only member with a PC and an SIO2PC
cable.) Both groups will shortly receive Pool Disk Too. You can order
it from Ernest R. Schreurs. Look up a message on DejaNews written by Bo
Schreurs about a month ago re: Pool Disk Too.

User group libraries constitute another source. For example, both my
user groups have disks in the hundreds and most contain BASIC programs.
Finally, Tom Hunt's Website and FTP site are good sources.

If you need any more info, please let me know.

Alan

I just visited the Digital Antic Project and was noticing how slow progress was. They still need disks (or dumped disks/programs) and issues (or scans, or typed-in files) to archive. The good thing about helping them out is that for each item sent to them it then gets distributed to hundreds (hey, it could happen).

Just reminding everyone it's there...

Actually it isn't cheaper because it was simply an add on for a 1050
drive. You had to have a 1050 to put the Happy mod in. They also
made a mod for the 810 drive.

Actually, it sounds like you've got an Atari ST, not an Atari XL. The bombs are indicative that the machine has crashed, probably the result of a bad desk accessory or AUTO folder program. The easy solution is to boot from a different disk then rename the .ACC files and the .PRG files in the AUTO directory. You can add them back one by one to see which one kills the machine.

Hopefully, you're running off of floppies, then this will be easy. If you're running from a hard drive, it gets to be much more of a bitch (I know from ugly personal experience), but try powering on the hard drive, inserting a bootable floppy in A:, then turn on the computer. As it begins the boot process (the floppy light blinks on), hold down Shift, Alternate, and Control at the same time. This should bypass the hard drive's auto-boot program, allowing you to load the drivers manually, install a hard drive icon, and then do the file rename. This may or may not work, depending on your precise set up (I spent a couple weeks on comp.sys.atari.st taking similar but slightly different suggestions from folks there without success, until I hit upon this combination).

Good luck,
Jeff

Jon,
You might want to pass that to Bill Kendrick to post on the Umich
Archive too.

yes, there was the Mosaic ... matter of fact, I had it... and years ago sold it... (ooops...)

there is a mod that Byrd/Torres made to a 16k board board that willl enable it to access, as an axlon, extra memory... (that was the drawback to mosaic... nothing used their bank select scheme...)

But, why is it an 800 can bank select... what's different here... and, yes, I've been told (bot have not found) that there IS a mod... out there somewhere...!
I wanted to avoid building the 64k mem board that Torres/Byrd had......

Well After getting back into the atari 8 bit frenzy with a $3 yard sale 400 and a $7 800XL and then a $20 1050 and then finding out my atari stuff was not destroyed in a flood in my ex's basement and it was not sold at a garage sale I now have my original omnimon'd 800xl and several USdoubled 1050's A disk holder crammed with 70 disks proved a little unreliable to find working disks from 12 years ago. Sigh. But one thing I found out is that single density disks have came through OK. I had some games I wrote that took me days and days. I put these on a single density dos 2.0 disk. And some of my best pinball construction set tables. I had all of my favorite games in thes disk holder and now very few work. I also just got a bag of loose disks back that were dumped from a box that did get flooded but guess what. Most of them seem to work. Now I'm dumping some things through an SIO2PC and APE or on to newly formatted single density disks. Gawd I have almost 600 disks.... sadly, my ultima 1 disk has a lovely green growth..

Mark

Well I can, but is Bill not able to access
alt.binaries.comp.atari8bit? It is easier for me to post it there and
have everyone who is interested in it get it from the newsgroup rather
than me emailing x number of individual copies. But like I said it's
no big deal if he is unable to get it there.

Ahhh... just what I didn't want to hear.

It's in my 800xl (256k Newell upgrade, 256k MIO, XF551, OS slightly modified for fast math, E:ditor, and Gr.0 screen dump). I was hoping for a simple 30-pin SIMM solution 'cause I've got a bag full of 256k SIMMs; but I'm willing to try something else if it's easier and cleaner. Only problem is the lack of space in the case (yeah, I know, get a 1200xl and hack on a PBI.)

I doubt there's much demand for any Sweet 16 memory hacks; there aren't more than a handful around. I bought mine from Mike at the TAF 'fest 4 or 5 years ago, along with SDX; at the time he said he'd sold 2 or 3 others.

There is an online Antic magazine resource that is being reproduced in
full and the creator of this site is also looking for mags to "borrow"
to get the info. from. I don't remember the web site but think about
it, how many 8-bit sites are still up? It's not to hard to find.

First off, I appreciate the help here, this seems to be a very tech oriented base rather than a
game oriented base, so thanks for putting up with this. Anywho, I did manage to get the AR character disk thing to work and am currently enjoying the City again. I would like to try Wizards Crown again, however when using a blank ATR to be labeled as disk 1(WC creates 3 game
disks for play)as soon as it attempts to create it I get a write error and a corrupted ATR file.
Any suggestions?

Try ABBUC. http://www.atari-computer.de/abbuc/ware.htm
If you're a member you can get it for 34,- DM including shipping, or 39,- DM
if you aren't a member.
It may be a bit more expensive if you live abroad, but I believe Holland
should be the same price.

```
The main program should be like this

PHA
TXA
PHA
TYA
PHA

main prog

PLA
TAY
PLA
TAX
PLA
RTS

That should leave your DOS in command with all registers as they were.

Howdy folks

Whenever I RETURN after I enter a line of BASIC (and only then), my screen flickers. Could it be that I delayed the signal comming from the PIA (PB1 if I remember correctly) too much? I used an HCF4050BE (no 74 infront of that), it should delay the signal 150ns (the shop told me the chi delayed all signals that much) before it gets into the LS373. I need a delay, because the pin of a PIA don't all switch at the same time (even if you program them to do so!!!) and I AND PB4 and PB5 before they lockup my latch.

Anybody know how much the PIA pins differ in time when switched? Or might there be an other soure for my problems.

CU Mathy van Nisselroy

PS as soon as I get this bug fixed, I'm gonna install a second PIA and 4 or 16MB. With seperate CPU and ANTIC banking. And no loss of BASIC while switching in extra memory.

```
No, a simpler approach is this:

Main code

TSX
STX OSTAK

and at the end

LDX OSTAK
TXS
RTS

DOS doesn't care about register contents.

(1) In your ATARI are several loads on the output lines of the PIA, several parallel capacity and several pull-up resistors. Therefore the signal edges are very flat, the rising and falling times and the differences between the portlines can be longer than 150ns.

How 'long' are the sparks on your screen, smaller or larger than one colorpixel?
(one colorpixel is around 550ns on european models, you have 160 of them per scanline (GRAPHICS 15))

(2) The 'AND' gate will also have some delay time. how much ?

(3) Wich BASIC do you use? In standard ATARI BASIC theres no $d301-switching after you enter a basic line! (or not ??? im not a basic programer)

(4) I dont know the exact switching time of your circuit (HCF4050BE), it depends very much on voltage (ok, you have 5V) and load. How much TTL/CMOS -loads do you drive from your HCF4050BE?

Also most ICs have several delay times on falling and rising edge, the best method to compensate this is to use an inverting gate and drive the signal through two of them in serial.

bye, Andrï¿½.

Jam!

Is a fantastic video line converter, I was recently given one by a friend and I have to tell you that its the answer to a lot of peoples pray's. Composite monitors that are in good shape are becomming harder and harder to find and many Atari 8-bit users want to use 80 column modes to display information and as everyone knows when you run in 80 columns on a color composite monitor you get ghosting and blurring. On a VGA or SVGA monitor using JAM you can plug in your composite video from you Atari 2600, 5200, 7800, Atari 8-bit, literally anything and use a VGA/SVGA monitor and the quality is superb!!! You can actually work in 80 columns and see whats on the screen. The one drawback.... You have to use a seperate source for audio, so you have to buy some speakers and hook up things for audio.

The point to my post was that I have received offers. Many of them, in fact. I have agreed to all of them so far, but the buyers seem to have gotten sidetracked.

Another valid point: No sense in answering this post, making an offer, unless and until you are ready to buy. As I said, I probably have what you are looking for. It costs $25 plus shipping. If you want it, it is here.

: So
: unless one wants to meet an outragious price for a dieninn market, he
: either has to have a gerater vision or confidence in the market than I
: or many others had at the time!

I'm not caught up on this thread, but I'll add my 2c anyway :)

I have to agree with Bob here, re: FTe doing good. Like Bob said, he got the rights to ICD stuff, and then turned around and not only released a bunch of it (SpartaDOS), but he worked on upgrading, if I recall.

Also, the Sweet16 upgrade, as a CPU upgrade, is great. Just pop 6502 out, pop Sweet16 in. Unfortunately, I know of very little software that does anything with this. <:^(

On the otherhand, Bob Woolley has pointed out that one can get up to 16MB of linear RAM while in 6502 mode (so no funky interrupt stuff needs to be done or any of that... things you need to do when you switch to true 16bit mode)

I do understand why people are complaing about him, but if what Bob said in another post is true, that Mike's still around and just waiting to come back, I'd take it easy on him and try to be grateful for what he has done. It's interesting how people jumped on him so much for not doing things he said he'd try to do, and forget all the things he did...

-bill!
nbs@sonic.net

Still wondering what to do with my S16! :)

I probably can.. I'm just too busy to deal with newsgroups much these days.
If the articles don't seem to drop off the newserver too quickly, I'll see
about archiving what I can off that newsgroups.

Your best bet, of course, is to FTP the file (AND A DESCRIPTIVE BLURB IN
A SEPARATE FILE!) to the "incoming" directory at UMich.

Or, if that doesn't work, e-mail it to me. (Remember the description!!!!!)

-bill!

4240. Atari 8-bit FTP and WEBSITE OWNERS! Read this!

Newsgroup: comp.sys.atari.8bit

Message-ID: <72squt$d30$5@ultra.sonic.net>
Source record: 58308

I can't stress this enough!

If you have an FTP site or website with Atari 8-bit files or programs,
please contact me about adding your site's contents to the index used by
"XL Search", the one and only multi-archive search engine for Atari 8-bits.

All you need to do is create an index in a tab-delimited text file (a ".qif").
This is identical to the archive files gathered and used by
"www.shareware.com", the site that inspired XL Search (mainly because they
refused to list the files at UMich for so long :)).

If you're too busy to write a description of every file, that's ok. People
will be able to find your file by filename. (I'm also considering creating
a category browse interface on XL Search, but that won't be any time soon.)

For information on adding your FTP- or Web-site's Atari files to XL Search,
visit the XL Search website:

http://www.sonic.net/~nbs/xlsearch/

Click "HELP" and scroll down to the bottom about "QIF" files.

If you can figured it out yourself and make a QIF file, simply fill out the
"ADD MY SITE" form on the "FEEDBACK" page.

If you need help or have any other questions or comments, feel free to
e-mail me via the "COMMENTS" from on the "FEEDBACK" page, or send me
e-mail directly:

nbs@sonic.net

Thank you! Your support of XL Search will in turn help all other 8-bitters!

Anybody else read the Computer Shopper? I use it to find bargains for my
Atari systems. Anyways, one of my favorite columns is "The Hard Edge".
In it this month, Bill and Alice list the Top Events of the last 20 yrs,
and the worst events.

The Atari 800 made the Top Events list (number 18)

;-)))))))))

My brother used to get it when it was the 'Silicon Gulch Gazzette', kinda a classifieds newspaper for computer hobbiests... Then it became computer shopper and got huge.

I read it for a while because of all the great regular computer columns (Commodore 8-bit, Amiga, Atari, TRS-80, Apple, TI-99, Adam, etc.) but once they dropped those and became an even fatter IBM rag I looked for other reading material.

> I use it to find bargains for my Atari systems.

Thrift stores and flea markets are my main bargain spots now, kinda fun if you have got the time and transportation.

It certanly was a cool machine when I first saw it in the Sears Wishbook (in 79 or 80, we had no computer then)... Wow color, hi-resolution, and four-joysticks! Quite an item then.

Everything on the buss is skewed when it switches state. The address, data and latch outputs will always lead or lag the bits to some extent. I use the 02 clock to sample any buss values - try that.
Screen flickering does not sound like a timing problem in your memory upgrade. What exactly do you mean by flicker? Losing sync for one frame?

Well,
I just found my original Dr. Wacko disk. Luckily it's a DOS 2 disk and still
readable after 10 years :)
I made ATR's and put them at
http://members.tripod.com/eightbits/classic.html
for safe keeping.
I also have some old (CGA) public domain atari games to download. They work
great on my 286 :)

From: "George T. Pasek Jr." <pasek001@tc.umn.edu>
Message-ID: <365330EF.8A88CB50@tc.umn.edu>
Source record: 58140

I picked up a 800Xl with the Atari 1050 disk drive, but I do not have the DOS disk to go with it. I have read the FAQ, and downloaded various emulators; A800DOS, Atari800win, & XLIT. Downloaded dos25.arc, and SI02PC. After reading everything I could find, I'm still not sure how to create a Atari DOS disk. The emulators don't appear to be able to format and write a Atari disk using the PC drive, and with SI02PC I could transfer dos25 to the Atari, but can't get it on the Atari drive because there needs to be a dos disk to use the drive:-(I'm kinda going around in circles here.

So I'm sure I must have missed something in my reading, please call me dummy and tell me what I missed, or at least point me in the right direction and I'll keep digging.

Thanks for any help

George

Ok here's the deal. Where you are now you only have to courses of
action.

1) Build an APE or SIO2PC cable. Hook up your Atari to your PC via
that cable. Run the APE or SIO2PC software on your PC. Download an
Atari DOS disk of some kind to your PC in .ATR or some other image
format handled by the APE or SIO2PC software program. Boot your real
Atari from the PC which is masquerading as a disk drive with a disk in
it. Use that DOS to format and put DOS on a blank disk in your real
Atari drive (selected as drive 2). After this you have a real DOS
disk for the Atari!

2) Have someone mail you a disk with a DOS for Atari and a terminal
program. Boot the Atari with the given disk, use the given terminal
software via a null modem (or real modem) connection to a machine (PC)
which has more Atari stuff you want. Use terminal software on the PC
side as well and transfer files via ymodem or something. For this
method you will of course need a serial port on your Atari to pllug a
modem or null modem into, unless you have an Atari SX212 modem which
can use an SIO jack.

No they ain't. On the plain 6502, you have to transfer X or Y to A first, then push A. My copy of 6502 Assembly Language Programming lists TSX and TXS as "new 65C02 operations."

A list of all the files that are within the ATR images of
the Pooldisk Too is on the CD. Unfortunately, this list
is 20 Megabytes, so it cannot be posted or E-mailed.
I will post a very brief list of what is on the CD later,
but for now let me tell you that it contains all the disks
in the Bellcom PD library, a very large portion of the
ABBUC library, all disks from SCAT (a user group
in Chicago) and all disks from the SAG library
(a user group in The Netherlands).
There are hundreds of disks from various other
PD libraries and user groups.
More that 5000 disks I'm sure.

Ian Chadwick did give us permission to put the text on our CD,
one of the reasons that we delayed the release of our CD,
and yes the name is Pooldisk Too.
So whoever is only interested in have the information that is
in the book without being able to read it in bed, the CD will
be the solution to the problem that the book is no longer
in print. (of course, of you have a notebook PC with
CD-player you *can* read it in bed from the CD.)

By the way Larry, Your CD's are probably hovering above
the ocean as I write this... Thanks for the order.

Keep those XL's/XE's humming.

hmmmm....
If you boot from SIO2PC drive 1 on the PC and have your 1050 set as drive 2, then you can format a disk in D2:, n'est ce pas? Now you have a DOS disk on your Atari.

ATTENTION: All Starbird Pilots Please stand by for top-secret transmission...Instructions for final, eleventh mission of the Halley Project follow... Observe special launching procedures to preserve secrecy of mission: To start, select Starbird mission but ignore first Starbird destination. Repeat: ignore first Starbird destination. Go to earth instead. To receive next destination, type this special code upon landing on earth: MINDSCAPE.

Follow Standard Halley project Operating Procedure (S.H.P.O.P) from here on. As always, you will receive clues for remaining destinations while in flight.

Good luck and solar salutes to all Starbird pilots. If successful, use enclosed card to notify P.L.A.N.E.T. Headquarters. All entries must be received by April 1, 1986. The possibility of reward may await for the fastest pilots.... End.

:)

Hey, any other original Starbird pilots out there?

In case I don't have time to reply to all of the offers I have
received right away here is the current status of the bidding.

The current high bid is:
125 Dollars plus shipping

Since many of those interested are from Europe lets agree that
all bids will be in US Dollars plus shipping so that all bids
can be evaluated equally.

In answer to some of the questions I received:

1 - No cards are included with the unit only the mainboard
I never was able to obtain any of the prototype cards.

2 - Yes this one does include the cream colored XL style cover
and the black front panel with the 1090 Label on aluminum panel.
I understand that many of those that are around do not have
a cover.

A few years ago (like 5? 6?) I played a "Dr. Mario" clone on my 8086 PC.
I tried whipping up something like it on the Atari, and got pretty far,
except I learned quickly that TurboBASIC XL sometimes isn't so turbo. ;)

Well, you're going to hate me because, as usual, I've decided to skip over
all of the other projects I said I was working on and do something new.
(Hey, I DID get GemDrop released, didn't I!?)

Anyway, the newest game planned now is: "Dr. Atario," a 1-player (and
possibly 2-player if I decide the Atari and I can handle it) "Dr. Mario"
clone.

For those who don't know, Dr. Mario is similar to Tetris and Jewels.
(On the Atari, we know these games best as Atartris and Line-Up, two excellent
games.)

I of course plan to use my funky flashing graphics mode to provide more colors,
but will also try to support flatter colors for those of you who can't
stand the <blink>blinking</blink>. :)

So far, after scratching my head a lot and looking through the Action! manual
and Mapping the XL, I've got a well-structured program that doesn't do an
awful lot... but, that's how GemDrop started, and the development process for
it was a thing of beauty, in my opinion. :)

Anyway, look for it soon... like, maybe before the end of the millenia. ;)

Unless you have dreams of exiting one program and re-entering a prior one in mid-execution so to speak, why bother with the stack?

The best way to exit back to DOS is with a JMP (DOSVEC). You don't need to worry about the stack as all self-respecting DOS stuff a $FF into the stack pointer as soon as they are entered. This holds true for SpartaDOS, MyDOS and Atari DOS (and all its clones).

With Sparta, you must use this method if your program has played with the E: or S: handlers i.e. closed and opened either one. If you don't you will be forced to hit Reset to regain control of the computer--sort of a "soft lockup".

How? I don't know THAT much about electronics. All I know is "borrowed" from
other people. :-)

>Screen flickering does not sound like a timing problem in your memory
upgrade. What
>exactly do you mean by flicker? Losing sync for one frame?
>
>Bob

Hmmm, how did it flicker? It shifted color (I believe I've seen purple) just
long enough for me to notice it. If I LIST a file, the screen sometimes goes
out of sync. and turns grey untill I stop it from scrolling by. I ran the
"DEEP RAM TEST" by Torsten Karwoth. Everybody in Europe seems to know it (the
text is in German) and tells me "If you have any timing problems, this one
will find them". But it only reports 768 kB instead of 1088 kB (I use PB0
instead of PB5) and NO problems. Damb, why doesn't it test BASIC, OS RAM etc.

>
>How 'long' are the sparks on your screen, smaller or larger than one
>colorpixel?
>(one colorpixel is around 550ns on european models, you have 160 of them per
>scanline (GRAPHICS 15))

They might be just about one colorpixel. Hard to guess how "long" it is. It
just turns purple for a VERY short time. I believe I saw only purple, might
have been some green and blue in there too. BTW If I LIST a file to the
screen, the screen goes out of sync and turns grey, turning to normal as soon
as I stop it from scrolling of if it comes to the end of the listing.

>(2) The 'AND' gate will also have some delay time. how much ?

It's an LS08. Somewhere between 8 and 12 seconds I guess. But the main
problem would be the PIA I guess. Stefan Dorndorf told me, his data sheets
tell him, the PIA pins change there status before the (oops, was that rising or

falling) edge of the clock. Or max. 500ns appart.

>(3) Wich BASIC do you use? In standard ATARI BASIC theres no $d301-switching
>after you enter a basic line! (or not ??? im not a basic programer)

I use the BASIC that was inside the XE when I bought it.
$D301 doesn't change, but the signal from the MMU switching the BASIC ROM does.
(BASIC is switched in and out as needed).

>(4) I dont know the exact switching time of your circuit (HCF4050BE), it
>depends very much on voltage (ok, you have 5V) and load. How much TTL/CMOS
>-loads do you drive from your HCF4050BE?

Yes, 5V DC. The HCF4050BE drives the LS373, which drives the MMU.

>Also most ICs have several delay times on falling and rising edge, the best
>method to compensate this is to use an inverting gate and drive the signal
>through two of them in serial.
>
>
>bye, Andrï¿½.

That would double the delay time. I guess I don't need that much delay. I
believe the delay to be too long rather than too short.

>>PS as soon as I get this bug fixed, I'm gonna install a second PIA and 4 or
>>16MB. With seperate CPU and ANTIC banking. And no loss of BASIC while
>>switching in extra memory.
>>
>
>PS: Wich adress will you use for your second PIA.?

From $D304 to $D307 (The first PIA will no longer be repeated in memory 64
times. Both PIA's will be repeated only 32 times.)

CU Mathy van Nisselroy

4271. Files using extended RAM

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-18 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <72u70nqdh2@nets3.rz.RWTH-Aachen.DE>
Source record: 58327

Howdy folks

This is for people who write/wrote software that uses extended memory.

Could you please (re)write it so that it checks which PIA pins to use. I've noticed that a lot of these files use PB5 to access banked memory. My Upgrade uses PB1 instead. (So I'm using PB0, 1, 2, 3, 6 and 7 and if I go to 4MB or 16MB also pin 2 and 3 and probably 6 and 7 of the second PIA (at $D305 = $D301 plus 4)

CU Mathy van Nisselroy

PS MyDOS doesn't have this problem, it automatically detects which pins to use (after you use option O from the menu). Meaning if MyDOS can do it, why wouldn't other pieces of software be able to.

Now that Bob Klaas of K-Products is no longer repairing 8bit Atari equipment, I'm in the need for somebody else to look at my 576k XE.

It occassionaly just locks up. Could be due to the tremendous amounts of power its needing due to 576k, SuperVideo, SuperAudio, 3 way OS switch, etc..

Larry and all,
The 80 column upgrade was never released by ICD. I read somenting a few months ago from Tom Harker that it was not cost effective or some such or that it really didn't work quite right. I forget.
Anyway, the entire MI/O manual is available in raw text and Winword 6.0 formats at
http://www.umich.edu/~archive/atari/8bit/Info/Hardware/mioman.doc . or mioman.txt. The .DOC version looks exactly like the original manual.

Sounds like a good idea to me. Automatic extended memory size
detection is something I'd like to include in my ramdisk. One of the
reasons I've not done it so far is testing it. I can write something
that will work on my machine, but that doesn't mean it will work on
other machines with different memory sizes/schemes. Maybe several of
us can work on this together and then release the source so that
everyone can use it. In fact there's already some source available
at HeAvEn's page:

http://www.s-direktnet.de/homepages/k_nadj/xebanks.html

Although I don't think this will detect your upgrade properly Mathy, as it
appears to always store a 1 in PB0. I guess this code could be
modified to disable interrupts (so that on stock and other extended
memory machines it doesn't crash when the OS is switched out) and test
PB0 too. Also it might be worth looking at the MyDOS source to see
how that works.

I've also put some thought into supporting larger extended memory
machines (4-16MB) with my ramdisk (at the moment it is limited to
using just 1 address for bank switching, be it PORTB or somewhere
else), it would take quite a big re-write, but it is do-able. The
problem again is testing, since I don't have a dual PIA machine.

Set your real disk drive to drive 2, set drive one on SIO2PC to your
DOS image. At the menu format drive 2 (real drive) and use the H command
to write dos files to drive 2.

Source record: 58157

To all those who subscribe to the UK magazine "New Atari User", you may or may not already know that the editor Les Ellingham has announced in the latest issue, Issue 85, which arrived yesterday, that he is planning to cease publication of NAU in 6 issues time, which will be around the beginning of the year 2000 if schedules go to plan but will probably be towards the end of that year. I know that many of you on this newsgroup come from the USA and so may not subscribe to NAU anyway, but to all UK users: what is going to happen? Les has published a damned fine magazine for 16 years so far, and for many years now it has been the one constant publication keeping the ATARI community in this country in touch with one another. The end of NAU is a long way off yet, but now we are going to have to start to think about the future without the magazine. Any ideas as to a possible way forward? Let's not fade away for goodness sake... Is there a possibility of some kind of special forum being set up specifically as regards this topic, because this is going to be one of the most important things ever to happen to the Atari.

> >>65c02's?

XL and XE's have the 6502C, the 400 and 800 machines have the 6502. (I
think you've got the 65c02 and 6502C backwards in the above line =).
The 6502C used in the XL/XE line is basically a 6502 with some extra
circuitry added to the chip itself so that the 6502C can be taken off
the bus whilst ANTIC is accessing it.

> >TSX and TXS are plain 6502 commands, don't worry!
> No they ain't. On the plain 6502, you have to transfer X or Y to A first,
> then push A. My copy of 6502 Assembly Language Programming lists TSX and
> TXS as "new 65C02 operations."

But that won't do the same thing. TXS copies the X register to the
Stack Pointer, and TSX copies the Stack Pointer to the X register.
This is the only way you can get at the Stack Pointer on a 6502(C)
processor. I guess you're thinking of pushing and popping the X
register to/from the stack, which is a command not available on the 6502(C).
If the 65C02 command for pushing X to the stack is TXS, then that's
where the confusion lies!

From: Anthony Baker <antbaker@arn.net>
Message-ID: <36546DEC.5D39AAC3@arn.net>
Source record: 58160

Hello,

A few months back I really got into my old 8-bits again and posted like crazy in here requesting all sorts of stuff for it. I kinda got side-tracked when Subspace (an internet-only game) and StarCraft came out for PC.

Well, Subspace is seems to be dying and StarCraft is getting boring. I recently went to a local "hole-in-the-wall" computer store and they had all sorts of old computers and old computer boards (even an original '77 TRS-80 10 Meg. HD).

Well, this computer store didn't have ANY Ataris. I asked him "how can you have an old computer shrine without Ataris?". He said he in desperate need of some and wishes badly that he could get ahold of them.

That started to get me to think (again) how wonderful my old Ataris are so then I started getting re-interested in Atari support, history, programming, and hardware.

My main point of this post is I am looking for a specific piece of hardware. Is there any modem manufactured for Atari (or can be used w/ Atari) that supports speeds higher than 1200 BPS? If so, is there also software made for it (now or in the past) to support those higher speeds?

Thanks,

antbaker@arn.net

There are no direct-connect modems made for the Atari that go faster
than 1200 baud. However, with an 850 Interface you can go at least as
fast as 9600 baud. I believe you can program the 850 Interface to go to
19.2 Kbps, but you'd probably need a handler that can manage hardware
handshaking at that speed. The P: R: Connection Interface can give you
a top speed of 9600, and some don't even go that fast. The Black Box
and MIO can get you to 19.2 if you use them as interfaces, and I believe
there are plans for an R-Vertor cable clone that might go that fast,
too. Of course, you can use any faster external modem, but you're
limited to the speed the interface will allow.

>nbs@sonic.net
The Pooldisk Too is written in ISO9660 format.
It is a double CD, the first one can be read on any ISO 9660
compatible system.
The second CD is in the ISO 9660 too, but it contains some
subdirectories that are more than 8 levels deep.
(it contains web-pages and such).
It is said that some systems cannot handle that. None of the systems
I know of have problems with it though.

I plan to order the Pool disk and I am currently wondering how to
deal with these .ATR files on my TT. I suppose I should ask Draco
if his XLemu read these file directly.

Message-ID: <19981120173139.25410.00000786@ng65.aol.com>
Source record: 58040

Kent Johnson wrote:

<<Every item $25. I have all makes of floppy drives, all models of 8bits, =
some with upgrades, all kinds of software. Search your heart and ask =
yourself is there anything 8bit you will pay $25 for? If so, I probably =
have it. Leave me Email compx2@javanet.com and tell me what, precisely, = you
want. I will tell you yes or no.>>

So that nobody really wastes their time, let's just clarify that most (not all)
of the "sellers" who adamantly refuse to make lists of what they have for sale
have nothing for sale. They just get a kick out of having people desperately
email them not knowing it's a complete waste of time. Or perhaps they are just
a tad lonely and enjoy some real company that isn't spam. If you want to test
this theory, (and I have in the past) put together the list of every single
Atari hardware/software item you can think of that every webpage always has
several of, and note that Kent probably will not have any of it.

And if Kent wants to prove me wrong, then he can spend 10 minutes out of his
day and type up a brief list like a, I dunno, professional seller might
actually bother to do. Otherwise, "then I saw your face, now I'm not a
believer."

Either way, I can think of hundreds of Atari 400/800 items that are not worth
anywhere near 25 dollars. But then so can everyone.

Good day!
Rod

They are ISO9660 or at least linux thinks so, i'm no CD expert.

I know because my Pooldisk II set came in the mail today.. JOY JOY! :)

Nobody should have to compute without these CD's, they are worth 10x the
asking price.

I have a nice 8086 IBM PS/2 w/ disk drives, hd and serial ports. Guy at
the flea market GAVE it to me for nothing, just happy to have someone haul
it away :) Works nice w/ APE, should work w/ SIO2PC too.

If anyone is looking for one, check your local thrift stores. I know there are
at least 10-15 8088/286 class PC's sitting in the local thrifts here, all
marked about $5 - $10.

Humm.. confirmation? I have a nice book called '6502 Assembly Language
Programming' by Lance Leventhal. It does list the TSX and TXS instructions.

Of all the 6502 books I have, this one has proven itself to be the most accurate
on many occasions.

Download the APE archive from the URL below, there is a nice free sector copier called MYCOPIER on the APE_WARP.ATR disk image. Tony Ramos comes to mind as the author, but its been awhile since I used it.

Bill Kendrick just posted a message about his XL Search page, you can probably find it there as well.

4309. emulators.com? (XFormer98)

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: Trevor Holyoak <trevorh@wfs.twc.com>
Message-ID: <3655F907.B003F67B@wfs.twc.com>
Source record: 58051

Anybody know what's up at Emulators Inc.? I ordered Xformer98 online a week or two ago, and followed up with an e-mail a few days later. I have yet to hear anything back. Is this normal?

Thanks,
Trevor Holyoak

You're thinking of push/pop X instructions. TXS and TSX instructions transfer
X to the stack pointer and vice versa.

Net-Tamer V 1.08X - Test Drive

4311. PoolDisk Too

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: sysop.fox-1@stackbbs.xs4all.nl
Message-ID: <911598542@stackbbs.xs4all.nl>
Source record: 58053

To all who wanted to offer themselves (or anyone else) a PoolDisk, Atari 8-bit CD-Rom...

The PoolDisk-Too (PoolDisk-2) is available right now ! It's a package of 2 CD-Rom's, filled to the end with Atari XL/XE related stuff...

Disk-1 contains all kind of software in the .ATR image format, ready to load into an emulator, or much better, the REAL thing, using an Atari 8-bitter with the SIO2PC hardware...

Disk-2 contains stuff like: Atari 8-Bit emulators for PC, ST, Amiga, and Mac, some seperate atari-files (not in ATR-format), pictures of: games, adverts, and screenshots from all kind of Atari computers, like XL/XE, Jaguar64, 2600, 5200, 7800, etc...

Also included are .AVI / .MOV movie-files from adverts, games and more of that, for those who're able to run these things on Mac, or Win-box'... Every Atari 8-Bit user, who has also acces to a platform with CD-Rom, should have these CD-Rom's. In the last few weeks I saw many questions about where to find software on internet for the 8-bitters. Well, ALL the titles I saw scrolling thru my Atari 8-Bit screen were available on the Pooldisk-Too !!!

Where to get it ??? Write an E-mail to Bo Schreurs in the Netherlands. He and his brother Ernest did collect and convert the xxx-MB's of files to images and created the PoolDisk.

E-mail to: stack@xs4all.nl for info, or to directly order your copy of the PoolDisk-Too !!!

If you live in Germany, try to contact ABBUC. They also sell copies of the PoolDisk. Even better is to became a member of ABBUC, the Atari Bit Byter User Club. If you are, you will be informed about anything new in the Atari 8-Bit scene !

Source record: 58054

```
< terminate: JMP (DOSVEC) or RTS ? >
It depents of the situation. What does the code do ?

If possible, I should use RTS, with resoring all registers you've changed
in your own code, like: colors, screen-margins, alternative fonts, DL/VBI
address', and not to forget, if it is a DOS-application, always reset the
keybuffer before exiting the program using a real key, like [Q]uit or
something. Many people forget about that. It's just cosmetic, but it's
not nice when exiting a program from Sparta-dos for example, and you find
yourself back in the commandline with a [Q] entered as command...

Just use:

LDA #$FF (#255)
STA $2FC (#764)

right before you exit the program...

Sorry if you already did, but I don't know your skill of coding :-))
(I don't even know mines :-))

4314. Pool Disk (1 and Too) - CD ROM format?? (ie, Linux compatible)

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: nbs@sonic.net
Message-ID: <732r08$5na$1@ultra.sonic.net>
Source record: 58164

What media format are the Pool Disks in? Now that I have some cash, and
a PC with a CD drive, I might consider getting a copy of one or both disks?

On the other hand, my PC is Linux, so depending on the format of the CD,
I may or may not be able to read it... (I can read ISO 9660 of course, and
the two Windows CD's I've tried reading were that format, and readable.)

Thanks!

(People complaining about ATR files on archives, when Atari's can't even read them...)

I have to agree. The other advantage is that DCM is compressed.
Why don't the emulators and programs like SIO2PC / APE support on-the-fly DCM->ATR decompression when you load a disk, and compression when you save or quit!? :)

That'd be sweet! :)

PS - Someone mentioned ATR->DCM conversion for Atari 8-bits? Where can one get this? What about something like DiskComm that loads ATRs instead? Maybe it's time to bug Bob Puff to make ATRComm! :)

4318. XL Search - up to a whopping 15,000+ files indexed!!!

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: nbs@sonic.net
Message-ID: <732rsb$5na$5@ultra.sonic.net>
Source record: 58168

Thanks to Ken Siders and Tom Hunt joining in on the XL Search bandwagon,
XL Search now holds an index of nearly 16,000 Atari 8-bit files!
Hundreds and hundreds contain good descriptions, and I'm planning on working
with Tom to describe huge chunks of his archive, at least minimally
(ie, title of the program, so you don't have to guess the filename).

Also, the XL Search e-mail gateway is back (and better!) For those of you
without web access, or who don't want to bother firing up a browser, you
can send e-mail to my address:

nbs@sonic.net

with a subject of:

xlsearch

(all one word, lowercase).

You'll receive a small help file in your box pretty much immediately. It
explains how to do keyword searches with XL Search via your e-mail box!
(Getting the files is another story... most files are on FTP servers,
though, so if you at least have an FTP client, you should be set.)

In the meantime, I'm going to look into adding the following kick-butt
features:

* ATASCII text viewer (at minimum, Atari TAB/EOL conversion)
* DCM to ATR conversion, for lazy PC users
* ATR to DCM conversion, for 8-bit users without PC's
* Atari graphic file -> GIF conversion (for at least a few popular formats)

All of these features will be web-based, so you'll need a PC or access to
"lynx" browser to use them.

Look for them soon! (Work's let up, and I'm hankerin' to do fun code! :))

In the meantime, enjoy the huge mass of files, and thanks Tom and Ken
(and Marek, of course, who was first to join XL Search after myself :))

>If the 65C02 command for pushing X to the stack is TXS, then that's
>where the confusion lies!

Whoever said that TSX and TXS are standard 6502 instructions appears
to be correct. I have a here in my hand a quick reference set for the
plain vanilla 6502 and it includes both instructions on it.

TXS is opcode 9A
TSX is opcode BA

The XLs and XEs have the 6502C while the 400/800 have the 6502. The
65C02 has some additional instructions which no stock Atari machine
can support. They are:

BRA
DEA
INA
PHX

PHY
PLX
PLY
STZ
TRB
TSB

4321. 800/800xl composite output question

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: abaddon88@aol.com
Message-ID: <19981120040908.11426.00000299@ng30.aol.com>
Source record: 58171

Hi guys,

I got an RCA closed-circuit video monitor. It is black and white, and as I don't know the meanings or differences between luminance, video, or chroma signals, I just tested each. Since 800xl has no chroma, the best connection seems to be the luminance output. I also have an 800 and will make a separate cable if chroma output produces a better picture. Well the question is: can anybody give me the background on these different signals? What considerations should be made since this is a b/w monitor?

Thanks atarians,
Blair

p.s. it's a cute little monitor with a great image!

Basically: Luminance (aka Luma) is brightness and Chroma (aka Chrominance)
is color level. Video (aka Comnposite) is a combination of the preceeding
two similar to what is output from a VCR.

With a mono monitor such as yours, the best picture comes from the
luminance output. Forget completely about Chroma and only try the
Composite if you want to play around with some grey-scaling.

Yup, that's why I suggested having a look at it *grin* You still need
to figure out which piece of the code does the work though, and check
that it does really really detect all the different memory expansions
properly. I thought Mathy had had a bit of trouble with the MyDOS
ramdisk originally.

Bill,
As you know, ATRs are full size disk images. DCM is not necessary for
this. Using either SIO2PC/A.P.E. or 1050toPC, the ATR images can simply
be copied to a standard Atari floppy or hard drive. DCM to ATR is simply
DCM for emulators. It creates ATR disk images from standard DCM'd Atari
floppies. You can DCM an ATR image from within an emulator and unDCM the
file on a stock Atari machine.

4328. Another modem question...

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: vinnie5757@aol.com
Message-ID: <19981120073914.27169.00000489@ng72.aol.com>
Source record: 58178

With the prices of modems getting cheaper and cheaper... where would be a good place to get a cheap 14.4? I ask because, if the 850 can handle, let's say, 9600... the 14.4 ought to kick down to that..(might be the easier way for ME versus figuring out how to increase the speed up to the 14.4...).. I have an old 2400 zoom.. might as well kick it up a notch... wonder if one can be made easily from a PC card??

Thanks..
Vinnie

Now that's a sad piece of news, although not entirely unexpected.
Unfortunately I haven't seen my copy yet (it's no doubt working its
way through the postal system). I've been thinking for some time now
that the way forward for the Atari 8-bit in the UK and the rest of the
world is on-line, through the internet, c.s.a.8, the archives, the Atari
8-bit related websites out there, and others. Unfortunately this will
mean that some people will miss out, but I don't see what else can be
done. I can't see a anything replacing NAU (such as a semi-regular
newsletter) and still being able to maintain a reasonable circulation,
plus whoever maintains it would most likely not be able to do
it full time (leading to something similar to the current NAU
situation). I guess all that can be done in the last 6 issues, is
gather together as many names and addresses of people still willing to
continue with the 8-bit as possible.

4330. Searching Sector-Copy-Prog

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-20 00:00:00 UTC
From: <>
Message-ID: <3655651b.0@uni-wuerzburg.de>
Source record: 58180

Hi !

Can anybody tell me what (good) sector copy programs there
are which run on X-Former ? Until now I used one
called "Tomscopy", but suddenly it doesn't work any more :-(.
I forgot: I want to use it with the X-Former cable.

Thanks, Bye

Michael

>mioman.txt. The .DOC version looks exactly like the original manual.

Does it include anything about the technical workings of the beast. Like where
it put's itself into memory? Or how the MIO's memory is accessed? Which
addresses are use?

CU Mathy van Nisselroy

PS I'm an XE lover and PC hater. Is there a reason why I should get the doc
file instead of the TXT file??

I do, I do. Or actually I have two.... that rimes (sp?)

First problem. If I boot without BASIC everything is OK. If I boot with
BASIC, the directory is empty although the free sector count is EXACTLY the
same a without BASIC.

Problem number two. If MyDOS 4.53/5 things you don't have a RAMdisk, (Option O
in the menu to switch it off, then H to write DOS to disk.) and I have RB6C
(Ramboot 6.c) autostart, it tries to format disk ZERO. It usually formats disk
ONE instead. I'm a pro in manually rebuilding directories.

CU Mathy van Nisselroy

PS I do have the source to MyDOS, I don't seem to have the source to RB6C, and
I know little about assembler.

4333. SIMM upgrade. I goofed

Newsgroup: comp.sys.atari.8bit

From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <733sen$c89$3@nets3.rz.RWTH-Aachen.DE>
Source record: 58183

Howdy folks

I goofed in a pretty big way.

Remember the flickering I told you all about, that appaired under BASIC when I was entering code or listing it?

Well.....

Some of not most of the 800XE's and 65XE's that were sold in Europe have a Graphics 9 bug. If you tell it to draw a BIG line on the top of the screen, where each line has a different hue (read: it starts out black then via shades of grey to white and back), it will err. Instead of smouth lines, you will see small circles on some lines.

Somebody developed an upgrade for this. It involved soldering three resistors to pins on the GTIA chip (pin 18 - 1kOhm, pin 19 - 470 Ohm, pin 20 - 1 kOhm) and ground (I used pins 2,3, 5 and 1 of te ANTIC chip). Well, that made the ANTIC run a bit warm. And started all the big problems with BASIC.

I toke the "upgrade" out.

Now I'm back to: Where is my Dup and Mem.sav after I Boot the XE?

Sorry if I smoked a brain or two. And thanks to all those trying to help.

CU Mathy van Nisselroy

>>--
>Raphael Espino

You're absolutely right, Raphael. I just pulled out my AMAC manual to "prove" there was no TSX, TXS in the original Atari and sure enough, there they are. I guess because I never (or rarely) used them, I thought they were the "new" push and pull X opcodes as you suggested.

The Leventhal book does say 65C02 and not 6502C, I guess they're two different chips as you suggest. The book cover says, "Second Edition, includes 65C02."

Yes, Jon Melbo, that's a real good book, published by Osborne/McGraw Hill. I think I did most of my learning on one by Zaks or something, though. I gave that one to my brother.

Did you try reconfiguring the page sequence for the MyDOS ramdisk
from the O option on the menu (choose N for use default page sequence)
for your memory expansion? It's a pain, and you have to be *really*
REALLY careful to get it right, but if that's right, then maybe it's
a problem with the way the MyDOS ramdisk works. Unfortunately the
MyDOS source is in Mac/65 and I'm an AMAC person =) (or should that be
Fortunately? *grin*)

argh sounds dangerous! I'll have to pass on RB6C (never used it).
What disk number should it set itself up as?

BTW did you get a chance to test Ramdrive and that new configuration
file with your expansion?

>I've been thinking for some time now
>that the way forward for the Atari 8-bit in the >UK and the rest of the
>world is on-line, through the internet, c.s.a.8, >the archives, the Atari
>8-bit related websites out there, and others.

Yes, I agree. There is still so much to be done with the A8, and so much
material
available, and so many topics that I think
would be of interest to many users.

AC (original) proved to me that although
there is a lot of casual interest in the A8, there aren't too many people that
are interested
enough to lay out $30 or so for a subscription.
(For a variety of reasons, I'm sure.)

I want to do something to fill the vacuum, but
can't do too much until retirement - a couple
of years, yet. I do know enough about the A8
to contribute, I believe.

Too bad about NAU, but it doesn't surprise
me either. I say "many thanks" to Les for
holding the torch for this many years! (I am
a subscriber.) In truth, NAU isn't my favorite
Atari printed magazine, but it is my favorite
that has been printed on a more-or-less
regular basis!

Amazingly, although I've been ardent user
for almost 17 years, I didn't know anything about CSA8bit until about six
months ago when I asked the sig managers on Delphi if
there were any A8 bitters left on Delphi.
They told me how to get to CSA8, and it's
just like Compuserve 10 years ago (but a lot
cheaper.) And now ther are users from all
over the world. I'm still amazed by the
internet!

Anyway, count me in. I'm in this for the long
haul!!!

>PS - Someone mentioned ATR->DCM conversion for Atari 8-bits?

Slightly off the subject, but does anyone have
a list of the various convertors for the Atari
and PC (and/or others) and what they do?
There are a bunch of them! I don't remember
seeing a full list in the Emulator FAQ.
If anyone wants to send me email with a
listing, I'll put them all together and put the final listing up on
alt.binaries as a text file, of course.

In late 1996, Emulators.COM offered all current owners of the XFORMER software a free upgrade to a Win '95 version. It took over 14 months for me to receive a copy here in Michigan.

I also imagine the company spends way more effort to support customers of the MAC emulators etc etc.

Good Luck!

Help,

Can anyone tell me how to get the Atari PC Card Drive (For the Atari Portfolio memory cards, 8 bit) to work with Win 95, yes I know it works with Win 3.11 and some German guys tried to write a program called 'FolioLink 95' but it was bug ridden and never worked.

Therefore would anyone like to take up the challenge and write a piece of software which would make these two items work together! or any other ideals?

Robert S Ely (rely@ix.netcom.com) wrote:
: Bill,
: As you know, ATRs are full size disk images. DCM is not necessary for
: this. Using either SIO2PC/A.P.E. or 1050toPC, the ATR images can simply
: be copied to a standard Atari floppy or hard drive. DCM to ATR is simply
: DCM for emulators. It creates ATR disk images from standard DCM'd Atari
: floppies. You can DCM an ATR image from within an emulator and unDCM the
: file on a stock Atari machine.

The problem with this is a Single Density ATR disk image, for example, is
at least a few bytes LARGER than the amount of space a SD disk can hold!

So if an Atari user wanted to try and use an ATR disk, not only would they
have to wait a few times as long (ie, 96K instead of, say, 30K for a typical
DCM file) but they'd end up with a truncated file to boot!

I'm trying to allow for the lowest common denomenator.

I've bugged Chad Wagner (author of "dcmtoatr") and asked if he'd mind
recoding it to do the reverse, so I can add a "download this ATR file as
a DCM" feature to XL Search.

It looks like nothing like this has been done (other than "DiskComm" itself!)

: I could automate putting it in whatever format it is that you require?
:
: - Trevor Holyoak

Probably! Can you write your own software on that server (ie, is it Unix,
or if it's PC, do you have development tools like a C compiler or BASIC?)

And what format are your indicies in currently?

On UMich, I build the index file needed ("atari8.qif") by running a program
I wrote ("makeqif", a C program for Unix) which looks at every file and
tries to find a descriptive ".blurb" file corresponding to it.

Tom Hunt looks like he made a program which concatenates all of his
"index" files from each of his FTP site's directories.

nbs@sonic.net

4347. XL Search - awesome new features!

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-21 00:00:00 UTC
From: nbs@sonic.net
Message-ID: <736bij$4s0$3@ultra.sonic.net>
Source record: 58065

XL Search now has the following awesome features!

* UnARC, UnZIP

If you search for something and get back any ".arc" or ".zip" archive files, there's a new option to view the contents of the archive.

From the contents listing, you can click on individual files and download them! (It's a little slow, since it needs to download the ARC/ZIP file off of the FTP site, so if you're considering grabbing EVERY file from within an archive, just download the whole archive and uncompress it offline.)

* ATASCII Viewer

If you hit a ".txt" file that looks funky in your web browser, it's probably an ATASCII file. If you see a ".ata" file, it's also probably an ATASCII file.

Now there's an option to view the ATASCII file in your web browser (converting it to 40 column HTML, with graphics characters converted to similar-looking ASCII characters).

But that's not all! If it looks graphics intensive, you can even view the file EXACTLY (requires a graphical browser, and patience!), down to the standard Atari 8-bit blue screen and bluish white text! :)

* Download DCM's as ATR's

If you see a "DCM" file and would rather download it as an ATR file (lazy bum!), there's now an option to do so!

------- Coming soon: ---------

* Download ATR's as DCM's

Hopefully the author of "dcmtoatr" (used in the feature above), Chad Wagner, has some time to help out and write a complimentary utility, "atrtodcm".

This will help Atari 8-bit users who don't have PC's, don't want to download huge ATR files when they can get smaller DCM files, and/or don't have a drive big enough to store an entire ATR file.

* Image Viewing

I hope to add support for GR7, GR8, GR9, and Koala (at the least) image viewing. (ie, the image will be converted to GIF and sent to your web browser.)

This probably won't happen very soon, and will of course require a
graphical browser.

* E-Mail Downloading

For those of you without web access (not even Lynx), I hope to eventually
add a download feature to the XL Search e-mail gateway. It will send
files as either MIME-encoded, or UUencoded (with the option of splitting
the file into bite-sized chunks).

-------end of coming soon stuff----------

Enjoy the new features, as well as the hugely increased index of Atari files
(now nearly 16,000!).

I've just recently discovered these ATR file archives, and I too would like to know if there is a program out there for the Falcon (which I use) or ST that can convert these ATR files into DCM files. I'd love to try some of these out on the 8-bit - but I don't currently have access to a PC.

So what is / where can I get this "XLemu" program?

(About .atr images, how to get to a8)
There is Tom Hunt's 'atr2disk.com' program. You can find it
at tzo.cth.com.
You'd need at least a single and a double dens disk drive, or
a single dens drive and a 192k ramdisk.
You download the sngl dens atr to the ramdisk, then also have
atr2disk on the ramdisk, then write the disk on the d1:.
anyways, Tom's program only does sngle dens atrs.

Is anyone interested in trading their 8-bit systems (minus monitor) for
a Mega ST CPU?
The Mega has 4 Meg RAM and an ADSpeed 16MHz board installed. Works
great and includes the keyboard.

I am looking for a 130XE with at least a double density disk drive and
some software.

Any takers? US only please. Thanks

Tony

I got a 800XL up and running and my 14 year old son said he would like to see some of the games that were out there for it. I checked the XLsearch sight and when I used GAMES as the search keyword it said there were 4000+ matches.

If you had a game that was your favorite or some that you really liked, what were the names if you please?

In this day of 3D hi-tech video, it's kinda refreshing to play with this system.

Tnx

George

4366. FS: BRAND NEW JAM!! DEVICE

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-22 00:00:00 UTC
From: "Stephen C. Johnson" <scjohnson@bigfoot.com>
Message-ID: <36584075.BDE1487D@bigfoot.com>
Source record: 58079

FOR SALE: AIMS Labs JAM!!
http://www.aimslab.com/Products/JAM!!/jamhome.htm

What does it do?

This device allows your Atari Computer to be hooked up to your PC's VGA Monitor. In fact, ANYTHING with an S-video output (VCRs, Camcorders, Playstation, Nintendo 64) can be hooked up to your Monitor!

How does it work?

It is a small box (about the size of a book) that connects your PC and Atari to your monitor. Your PC and Atari can be hooked up to the monitor simultaneously-- no cable swapping. Your PC does not have to be powered on to play the Atari.

What does this mean?

Basically, you will see your Atari Video Display like you never have before--- ultra high resolution, crisp images, vibrant color, on a big Screen! No more getting "kicked off" the family boob tube. Bring the Atari to work :)

Why am I selling it?

I received two as gifts, and don't need two!! I would return it to AIMS Labs, but they charge a 20% restocking fee!!! Since I was bought it for $80, this would set me back $20 (with shipping). I want to sell it for $70 ($10 cheaper than I've ever seen it), so I only lose 10 bucks instead of $20. If anyone sees it on sale for less than $80, let me know. I believe that is as cheap as you'll find it.

How Much?

$70 + shipping. This is a NEVER OPENED, BRAND NEW product. The stickers that seal the box are still intact. I only have one to sell. MONEY ORDERS ONLY, unless I have traded with you before. References available.

If you are interested, e-mail me at:

scjohnson@bigfoot.com

Thanks,
Steve

Other posts on this group have reminded me of the following:

1) you need to build an S-Video monitor cable for your Atari for this to work (I can supply parts and plans)

2) the 400 will not work with JAM, the 800 is great, and the XLs need the supervideo upgrade.

Hope that clears some things up.

Thanks,
Steve

Oh, another possible solution: If you have an 800XL (or any XL, I think...) there is NO CHROMA SIGNAL coming from the monitor port!!! You need to perform the supervideo 2.X upgrade to enable this feature.

Thanks,
Steve

Vidar \"Hawk\" Olavesen (olavese@online.no) wrote:
: Wasn't that something like this
:
: 10 OPEN #1,4,0,"K:"
: 20 GET #1,A

Yep. To describe exactly what this does:

10 - Opens I/O channel #1 for input (4) from the "K:" (keyboard) device.
20 - Attempts to read from channel 1 (keyboard), placing the results (the ASCII character value) in the numeric variable "A". It will "block" (wait) until a key is pressed...

You might want to add another line that sticks that in a string for you:

30 LET A$=CHR$(A)

Note, however, that in Atari BASIC, you must declare the size of any strings you use. (Unlike C=64 and Apple II BASICs, strings aren't limited to 255 characters.) So you'd want:

5 DIM A$(1)

(1 character is all we need)

: Been a long time, but that is one way I think and another would be to
:
: 10 POKE 764,255
: 20 IF PEEK (764)=255 THEN GOTO 20
:
: Please correct me if I am mistaken on the location, as it's been probably
: 10 years since I touched the BASIC

This is a bit different. Memory location 764 is updated every cycle by the Operating System. It contains an internal (ie, NOT ASCII) code for the key that's pressed. All keys except HELP, SHIFT and CONTROL are detectable. (SHIFT and CONTROL are detected, but not alone... ie, "SHIFT" would do nothing, but "SHIFT+1" would set a value).

255 means "nothing is being or has been pressed".

Once the value of 764 changes, it remains that value until one of two things happen:

1. You clear it (POKE 764, 255)
2. You read a character from the "K:" device (ie, the OS clears it)

So if you want to loop and do stuff, and occassionally grab a character
(ie, whenever someone presses a key), you could do:

```
5 DIM A$(1)
10 OPEN #1,4,0,"K:"
20 LET A$=""
30 IF PEEK(764)<>255 THEN GET #1,A:LET A$=CHR$(A)
40 IF A$="C" THEN PRINT CHR$(125):REM (((CLEAR THE SCREEN)))
50 PRINT "HELLO!";
60 GOTO 20
```

The computer will display "HELLO!HELLO!HELLO!" all over the screen.
If you happen to press the "C" key, it will clear the screen.

If you don't want to depend on the OS "K:" routine, you'll need to
figure out what values in 764 correspond to what keys. Here's a new
program:

```
10 IF PEEK(765)=18 THEN POKE 764,255:PRINT CHR$(125)
20 PRINT "HELLO!";
30 GOTO 10
```

(I believe "18" corresponds to "C"... I can't beleive I remember it tho!)

I think a table of 764 <-> Keys chart exists. Possibly in my
New User/Emulator Help FAR (which, while extremely out of date on the
emulator aspect, is still pretty useful for new users like yourself!)

http://www.sonic.net/~nbs/new_and_emu.html

If you don't have web access, you can have a Lynx-generated text copy sent
to your e-mail instantly by using my e-mail gateway.

Send a message to me: nbs@sonic.net
With the exact subject: send emulator faq

If you want a quick hack to figure out what 764 keycode belongs to a key,
do this:

```
FOR A=1 TO 1:PRINT PEEK(764):NEXT A
```

It will being displaying "255" all over the screen. Press a key and the
number will change. Press [BREAK] to exit the loop. (Note: once you exit,
since 764 was never cleared, BASIC will grab the character, and whatever
you pressed will appear after the "READY" prompt. Just hit [BK SPC])

Good luck!

-bill!

Actually, could you explain this a little? Bob Woolley mentioned the JAM!
device the other day on the phone and I ordered it right after hanging up
with him. :)

My 1200XL (which Bob should be getting today to do some work on) has a
SuperVideo upgrade.

My 800XL that I have here does not. What does this mean for me?
Will it not work at all? Or will it look bad?

Also, explain exactly what's needed to make this cable. I understand it
comes with a cable for PSX when you buy it (I just happen to have a spare
PSX :)), and I'm assuming it connects to that little rectangular plug in
the back (what exactly is that?)... but what's on the other end?

Thanks!

This will work pretty good but will hang if you press a key that doesn't
generate
a character: Inverse, caps, ctr-4, most shift control combinations it will
"hang"
until you press one that does.

One way to get around this is to read the code from 764 do a look up in the
keyboard table in ROM by using the fixed location if it is a 400/800 or via
the
pointer in XL/XE's. Then set location 764 to 255 to clear it. This will
provide
a debounced key but no key click. There are a couple of hardware locations
where
you can determine if a key pressed and find out what it is (same as location
764 but without the OS processing of the key repeat delay and stuff).

Supra used to sell a 2400 modem, but I think it was really a standard
2400 bundled with an R-Verter cable. Most interfaces for the Atari 8-bit
can handle speeds up to 9600, and some can do 19200. For software, there
is BobTerm (40 columns), or Ice-T or FlickerTerm (80 coulmns).

Well, if you have a modern PC it's easy with Steve Tucker's converter.
Does lots of conversions in any direction.

Actually the guy to ask would be The Shadow, David is really
really good at programming the 8-bit, but if I recall you could
do it in two different ways:

1. would be to open the Keyboard and than use the Get command and
the channel number along with the variable. Such as

```
10 OPEN #4,4,0,"K:" REM Opens keyboard for reading on channel 4
20 GET #4,KEY REM Gets input from keyboard and stores
ascii code into the varaible 'KEY'
```

2. The other way would be to use a POKE and read the key code
from the keyboard. This is the ATASCII code for the key pressed.
Such as

```
10 Poke 764,255 REM Clears keyboard handler
20 Peek 764 Reads keyboard memory location
a (255 here is no key has been pressed)
```

Sorry it has been sometime since I have wriiten code for the
8-bit.

Well, he said "I don't currently have access to a PC", so Steve's
converter isn't a good suggestion in this case! ;)

I'm hoping someone will soon write the reverse of "dcmtoatr" and release it,
mainly so I can add a "download ATR as DCM" feature to XL Search.
(I already have the reverse, and am using Chad Wagner's "dcmtoatr" to do
it in the background on the webserver.)

Unfortunately you can't do it quite so easily, from fuzzy memory it's
something like so:

10 Open#1,8,0,"K:"
20 Get #1,A : A$=CHR$(A)
30 If A$="" Goto 20
40 Close #1

Probably pay to check the BASIC ref. manual, haven't played with with a.
basic for about 10 years :-/

I just hooked up my SIO2PC cable to my "new" Pentium PC (I only had some XL's and my old crappy IBM PS/2 8086) and tried out "femul" (aka SIO2Linux) by Preston Crow and Pavel Machek.

It worked great! (One thing I had to change was to force it to look at my #1 serial port ("/dev/ttyS1") since by default, it looks at #0, UNLESS the "/dev/mouse" mouse device is symbolically linked to "/dev/ttyS0". Well, mine wasn't, it was linked to something differently-named, but obviously the same.)

Anyway, for those of you who have Linux (I'm using RedHat 5.1 on a Pentium 133) try it out with your SIO2PC cable! (Note, I haven't done much testing... just booted MyDOS and ran "fujispin") No more need to install a DOS partition or run "dosemu" or have a 2nd computer around. (I'll be SO happy to get rid of that damned 8086.. it's ugly, unreliable, and weighs a TON!)

http://atrey.karlin.mff.cuni.cz/~pavel/atari/

Thanks Pavel and Preston! (And of course thanks again to Nick Kennedy for the idea to begin with!!)

From: "David A. Paterson" <david_p@storm.ca>
Message-ID: <73biq1$q80$1@news.storm.ca>
Source record: 58002

Personally, I'd do it like this:

```
10 DIM A$(1)
20 OPEN #1,4,0,"K:"
30 A$="":IF PEEK(764)=255 THEN 50
40 GET #1,A:A$=CHR$(A):POKE 764,255
50 ... carry on main loop here
90 GOTO 30
```

This way, you're not stuck waiting for a key press (unless that doesn't matter to your program). If LEN(A$) is 0, there's no key press. Only problem is when you press a key combination that alters location 764, but isn't a valid key.

4386. Re: FS: BRAND NEW JAM!! DEVICE

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-23 00:00:00 UTC
From: "Stephen C. Johnson" <sjohnson@mitre.org>
Message-ID: <36596171.BB8F1EB4@mitre.org>
Source record: 58004

Hi Bill--

Well, the documentation for the SuperVideo upgrade explains everything better than I can, but here's the short version:

The Atari computer monitor port (800's and up), contains 5 pins. The 5 pins "should" contain ground, composite video, chrominance, luminance, and audio. The JAM takes Separated Video (S-Video) input, which is actually just a 4 pin connector that carries chrominance, luminance, and a ground for each.

So....

The Atari 400 only has RF out (composite+audio), and no monitor port, so that won't work with a JAM

The Atari 800 has all 5 coming out of the monitor port, so that will work with composite monitors or the JAM... the video quality is very good.

The monitor port on the 800XL (and all XLs?) only has: ground, composite, luminance, and audio. On top of that, the design of the video circuit is pretty poor (according to the SuperVideo article). The SuperVideo upgrade corrects the video quality problem, and adds the chrominance channel to the monitor port.

To answer your questions

1) The stock 800XL should work with the JAM's S-Video connector, except you will only get Black&White (luminance) display.
2) The S-Video Cable can be made by soldering the 4 wires of an S-Video cable to the appropriate pins on a male 5 pin DIN connector-- I don't have the pinouts here at work, but I can get them to you if you want them.
3) The Playstation has a GREAT video out connector, and actually supports S-Video and full RGB-- my buddy actually built a Playstation RGB cable, and it is awesome.

Hope this helps,
Steve

P.S.-- How much did you pay for your JAM? If it's worth your time, I'm selling one for $70 plus shipping :) --sorry, had to plug... ;)

Darek is very slow and very unreliable. I never got my XFormer 98 upgrade
but since all the other emulators are 10 times better I really dont care.

Look for Atari800win its much much much better. Darek never could figure out
how to get sound to work (even though a great pokey sound routine was
available off the net).

Stay away from XFormer 98 its a waste of cash.

4389. Avalanche?

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-23 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <36596CA0.C90B2D85@erols.comX>
Source record: 58007

I was rummaging through my 8bit disks the other day when I came across a game called Avalanche by Atari. The copyright is 1980. The reason I'm writing this msg is that the game is VERY similar to Kaboom (copyright 1981) but not as fast nor fun.

The game has a row of boulders across the top that drop randomly and you need to catch them in your buckets before they hit the bottom.

I was kinda curious if anyone else has seen this or know if it was written by one of the Activision guys before leaving Atari?

Here is a excerpt from the Atari Historical Society's web page:
http://www.atari.nu/arcade77.html

"Another Dennis Koble effort, Avalanche is a great example of a game that everybody has played but probably doesn't know. There's no question that Activision's Kaboom (by Larry Kaplan, another Atari alumnis) was a rendition of Avalanche. And while we're on the subject, Drag Race, which came out 10 months earlier, has since become Dragster, another Activision Title. "

cheers,
Steve

Back In Time, a web site dedicated to all Atari games and computers, has recently expanded, and moved to a new web host at http://www.emuclassics.com/backintime.

The site has information on all Atari game consoles including the 2600, 5200, 7800, Lynx, Jaguar, Pong, etc. Atari computers are covered extensively. Those systems include the 400/800, XL, XE, ST, TT, and Falcon series. Other Atari devices, such as the Hotz Box, are covered. Up to date news on the Atari scene is included. Emulation of these systems on the PC platform, along with arcade emulators, is included. The site also looks at some prototype and vaporware equipment.

The site is full of history and photos. Good Atari web sites are vanishing from the web. It is my intention to make my site a leader in Atari coverage. If you love Atari, you will have to check out Back In Time

4392. Atari XL/XE Operating System Disassembly

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-23 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.981123063641.27769A-100000@vtn1>
Source record: 58010

A while ago Rene and others asked me for these. Now that the 8-bit's
finally running again I got them out of the ATS files and checked
them out.

The three attachments contain archives of my disassembly of the
XL/XE OS. Analysis and commenting is about 90% complete. Some of
the code that can be found in the 800 is commented and labeled
as it is in the Technical Reference Manual except that I converted
many labels to local.

The .M65 files were tested yesterday and will assemble an exact
duplicate of the OS ROM--all 16k of it. To verify an assembly
it is easiest to move the OS to RAM at $4000-$4FFF and $5800-$7FFF
and then drop bit 7 in PORTB to enable the self test ROM. Bsave
$4000-$7FFF to a file, hack the header bytes if you want, and
then compare the file with an assembly.

If you want to assemble without the self test ROM, remove the
file references to ST1.M65 and ST2.M65 and remember to re-set
the org before the floating point.

The three versions attached all use ATASCII end of line and are
ready for use. The .M65 version is tokenized and usable with the
latest disk-based version of MAC/65 as well as with the cartridge.
The .LST version is the same code in "LISTed" format. Here, the
line numbers are the actual decimal addresses of the code they
assemble. The .SRC version is most useful for browsing with
TextPRO and would probably be the best bet for AMAC users.

If the attachments don't work, let me know and I can e-mail you
in UUE format.

Rene: Really apologize that this took so long.

Actually, you may have it backwards. I think Atari might have came up with
the game first, and then Activision might have adapted it.

I'm not sure if this is true. But Avalanche is one of the video games that
MAME plays -- this is the arcade version, not the version for the Atari.
I wasn't able to check the date just now, but judging by the crudeness of
the graphics, the game may possibly have come out in the late 70's or 1980.

In no particular order:
Zybex, Draconus, Ballblazer, Dropzone, Line-Up, Montezuma's Revenge, Tekblast, Miecze Valdgira, Miecze Valdgira II, Operation Blood II - Special Forces, Mercenary, International Karate, Deimos, Cavernia, Star Raiders, Star Raiders II, MegaMania, Boulder Dash, Boulder Dash II, Defender, Donkey Kong, Ultima IV...

Too many to list :)

There are many to choose from, including the sports games -- Hardball!, Star League Baseball, Starbowl Football, Major League Hockey, World Karate Championship...

Some classics like Star Raiders, Choplifter, Miner 2040er, Frogger (Sierra On-Line version), Bruce Lee, Castle Wolfenstein (somewhat difficult; it's sort of like an early pre-cursor to Wolfenstein 3-D, only that it's a third person perspective) are good fun. Basically some of the games you want to get first are the arcade translations, as they're part of Atari's cornerstone -- Pac-Man, Donkey Kong, Pole Position, etc.

Other of the more "contemporary" games (e.g. original) would be the Lucasfilm games (Ballblazer & Rescue on Fractalus in particular), Boulder Dash, Juice, Blue Max, Jumpman/Jumpman Jr., Summer Games, Montezuma's Revenge, Pinball Construction Set, Night Mission Pinball...and of course, you can't miss those Infocom text adventures.

Ballblazer: best two player game ever, for any system.
Boulderdash: I could play this over and over forever.
Bruce Lee: great action/adventure game. Fun two player option.
Robotron 2084: best game ever, anywhere, anyhow. Duct tape two WICOs to plywood to be able to fire behind you as you run.

About the only Portfolio "stuff" I have left are the following items:

- File Manager / Tutorial ROM Card w/users manual
- Portfolio Quick Reference Card
- Portfolio Owner's Manual

If you can use any of these items, let me know.

From: Jeff Haas <jhaas@ea.com>
Message-ID: <73cgdp$cp9$1@supernews.com>
Source record: 58020

In case anyone's wondering, here's what happened to Gamestar.

It was started by a guy named Scott Orr in Santa Barbara in the early 80's. Their first game was Baja Buggies, followed by a football, baseball and super sprint (top-down car racing) game. The first platform supported was the Atari, but they did stuff for everything including the IBM PC at the time. Eventually Scott sold the company to Activision and moved to Silicon Valley. Eventually Activision, under its old management and ownership, folded, and Scott became a designer and consultant for a couple of years, and designed a couple of significant games for Electronic Arts...the biggest one being John Madden Football for the Sega Genesis.

Soon after, he went to work for EA and became the producer of Madden Football, a position he still holds to this day. (Although now he's an executive in charge of production.)

I know him because I met him while I was at the University of California in Santa Barbara, and later I went to work at EA. I've been working for him for years now. Occasionally he's mentioned Dutch Dugan as a passing reference, but I think Duke Nukem is probably the closest thing we've seen so far.

From: rwoolley@postoffice.pacbell.net
Message-ID: <365A3D03.56BEAC6F@postoffice.pacbell.net>
Source record: 58022

The JAM!! has two inputs, a monochrome - intensity input and a color input, both of which are on a S-Video plug. Normal separate video uses both of these to produce a nice color image. If you plug your Luminance input into the RCA adaptor provided with the JAM!!, you will not get color. You must plug the composite plug there to see color. This is actually the CHROMA input of the s-video pair - if it sees video luminance, it goes into composite mode. The only way to use separate chroma on this guy is to make your own cable - which isn't too hard. Otherwise, use composite only.

From: Trystan Negus <tnegus@matra.co.uk>
Message-ID: <73bk6k$7t7$1@guardian.matra.co.uk>
Source record: 58024

I've two questions that I would be extremely grateful to have answered!

1) I've salvaged my old 800XL, which has lain dormant for around 5 years. On switching it on, the memory test immediately comes up, and a large proportion of the RAM is displayed in red. What on earth would cause this if the thing hasn't moved for so long? I've taken the computer apart, and briefly checked the contacts, but not very thoroughly. Has anyone any information/help/pointers?

2) I heard from somewhere that if the Atari PSUs were plugged in, then they were very likely to overheat and melt/ignite/explode in a shower of fireworks (take your pick) unless they were actually connected to a switched-on computer or peripheral. Is this true? Do I really have to unplug my extension every time I leave the computer off for a while?

Thanks in advance,

Trystan

The Video Game Advantage Definitive Known Software List Collection

If you are looking for the most complete, detailed software lists
available you have found them. And the best part is that they are all
in a standardized format, so you can change system files without
having to learn a new style or format! Currently 32 of the 40 planned
files are on-line (2600, Intellivision, NES, Odyssey2, Sega CD, SMS,
SNES, and TG-16 all still need some work, and will be on-line as
soon as possible).

32 bit and 64 bit video game systems:

3DO REAL Interactive Multiplayer
Atari Jaguar / Jaguar CD
Commodore Amiga CD32
Nintendo 64
Nintendo Virtual Boy
Sega 32X
Sega Saturn
Sony Playstation
Tiger Game.Com

16 bit video game systems:

Philips CD-i
Sega CD
Sega Genesis
SNK Neo Geo / Neo Geo CD
Super Nintendo

8 bit video game systems:

Atari Lynx
Nintendo Entertainment System (NES)
Nintendo Game Boy
Sega Game Gear
Sega Master System (SMS)
TurboGraphx-16, CD, & Duo

Classic video game systems:

Atari 2600
Atari 5200
Atari 7800
Bally Astrocade

Colecovision
Emerson Arcadia 2001
Fairchild Channel F
GCE Vectrex
Magnavox Odyssey2
Mattel Intellivision
Milton Bradley Microvision
RCA Studio II

Classic computers:

Atari 8-bit computers
Coleco Adam computer -- see Colecovision
Commodore 64 / 128 computers
Commodore Vic-20 computer
IBM PC Jr. computer
Mattel Aquarius computer
Radio Shack Color Computer
Texas Instruments TI 99/4A Computer
Tomy Tutor 16-Bit Graphic Computer

>written by a amatuer 8-bit programmer and >submitted to atari for release...

Yes. It is listed in my Summer, 1983 APX
catalog. Kaboom was first a 2600 title, and
probably out prior to 1981. Maybe
before that, because I bought it before I got
a Colecovision, and I think the CV was introduced in 1978 or 1979. I'll have
to check
on that. I think "Chicken" from Synapse was another spin-off.

Avalanche was an arcade game by Atari.
It was converted for the computers in 1980 (by Atari) and sold through APX.

In 1982 or so, some guys at /|\ decided to leave the Warner firm.
They were unhappy of the situation there, as their names were never mentioned on the cartridges, manuals or boxes (this is why Easter eggs with the programmer's initials appear in some games).
They founded Activision for more recognition and borrowed some game ideas from Atari.
This is why Kaboom! is a clone of Avalanche (same for Dragster and Drag Race).

Howdy folks

Rafael James Espino said:

>Sounds like a good idea to me. Automatic extended memory size
>detection is something I'd like to include in my ramdisk.

Or you could use one utility, like a memory checker/tester, to detect the size and page sequence and have it write this info out to disk. The other files would then check if this sequence table already exists (otherwise it would run it's own detection code or use a preset sequence/size).

CU Mathy van Nisselroy

BTW that's MacFalkners idea. Not mine. But I like it.

4419. US Doubler, hardware help needed.

Source record: 58037

Howdy folks

A whiel ago, Bob Klaas released the code to the US Doubler.
But the US Doubler consisted of TWO chips. Could somebody please tell me what that other chip was/is? RAM maybe? How big?

CU Mathy van Nisselroy

PS Years ago, I saw a 1050 with a Super Speedy upgrade. The Speedy upgrade is very famous in Germany (among Atari 8 bitters). It adds very high speed and true double density ofcourse. The rights to this thing are now in the hands of the ABBUC (the German Atari 8 bit user group that has approx. 470 members all over the world. Their magazine is in German). They also have the schematics. Unfortunately they miss the plan to the SUPER Speedy. It was a special version of the Speedy which was only sold to the ABBUC and Pokey (a Dutch user group which no longer exists). Why you ask? It came with a special version of BiBo-DOS (some kind a DOS) that would unleach all of the Super Speedy's power. You see, the Super Speedy had enough RAM inside the 1050 to copy a disk WITHOUT the data ever getting inside the computer. This sucker would read a file in under 10 seconds. And format and write one in under 30 seconds. Seen it myself. Unfortunately, the plans of this one seem to have disappaired from the face of the earth.

4420. 1050 drive complete in box for sale

Newsgroup: comp.sys.atari.8bit

4421. Atari Jaguar vendors?

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-24 00:00:00 UTC
From: Michael Chandler <mchandle@earthlink999.net>
Message-ID: <18B62.4$G4.344109@newsfeed.avtel.net>
Source record: 58089

Does anyone know of any vendors or suppliers who are still distributing the Atari Jaguar to resellers for retail? I've asked this before and got a bunch of people wanting to sell me a Jaguar for $40 and such. That's not what I need. I'm looking for suppliers and distributors who still carry quantities and have dealer pricing.

If anyone knows any names and numbers, your help would be most appreciated.

Thanks

4422. Emulator help please

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-24 00:00:00 UTC
From: Robert Glanville <robglan@home.com>
Message-ID: <365AFDC4.AFE3B503@home.com>
Source record: 58090

After playing Star Raiders many years ago on a friends Atari 400 I developed a great respect for the Atari and have many fond memories. At that time I had a TRS 80 and would have killed for an Atari!

I would like to run Star Raiders in particular and other games as well on my PC. I downloaded Atari 800 emulator for windows version 2.4 and requisite roms. At this stage I get the memo screen loading and can do little else with the emulator.

I read the FAQ's etc and cannot quickly see how to load and run a file.

If someone could offer their assistance I would be very grateful (and may add you to my Christmas list!!)

Thank you in advance

Rob (robglan@home.com)

Message-ID: <73f9ebnkt1@garnet.nbnet.nb.ca>
Source record: 58092

I have an 800XL that I picked up from someone.When I hook it to my tv and turn it on the screen turns blue and a medium pitched buzzing noise comes from the TV speaker.No cursor or response to keypress.

No matter what I try it continues to do this... could there be a simple solution to this problem? Does this problem sound familiar to anyone?

I have a 600XL and it works fine with the same hook up...Any help or advice would be appreciated. Thanks.

Davis Leeman

In no order, a few different ones from the rest of the pack:
Gamestar Baseball, Retrofire, Gauntlet (not the arcade game, but the
freeware game by Donald LeBeau - whatever happened to him?), Spelunker,
Solo Flight, Jumpman, Mig Alley Ace, Castle Wolfenstein (I actually won!
A friend of mine and I would both play at the same time, one moving and
one firing), Crisis Mountain, Drelbs, Necromancer, Mountain King,
Ballblazer, Fractalus Rescue, Pharoah's Curse, Fort Apocalypse, Starcross
(because it was my first Infocom adventure experience).

I'm sure your right, but I too have a problem running programs on WIN800_2_4. The full disk .atr's boot and run, but the .com and .exe ones I have won't run using L. On my 800xl I use the DOS 2.5 "L" command, D2:pacman.exe and it runs. If I do that on the emulator I get a #146 error "Function not implemented in Handler". The FAQ says to put it a hard disk and run it from there, H1:pacman.exe and this gives me a #160 error "Drive number Error".

I'm using the DOS_2.5 os and the ATARIXL.ROM.

Hi all,

This is a first for me posting to a news group and all. Very interesting in seeing how many Atarians still thrive in the day and age of pc's. Well, to cut to the chase, years back my brother came up with the proper timings for an 520ST to talk to an 800. Then, thru many late nighters, I finished of the routines with a bit of GEM Windowings and the such and VIOLA! 810uLator was borned. I have it at my web-page, it's in pretty good shape and I'd like some outside impressions of it. It can be found at http://www.icubed.com/~ksharp/

I still have the source for it and I've even got a working 815uLator (some where). I haven't had time lately to verify the file format for the disk images, I think they need an 'ATR' or '810' extension on them.

Well, just like seeing the ones hang around.

Kevin

It's not the .atr's that I'm having a problem with, it's the .com's &
.exe's. DOS 2.5 on the Atari 800XL will run the packman.exe fine, but
when I do the same on the WIN800_2_4 emulator (using DOS 2.5 also) I get
the #146 error.

Hmmmm...

I would *normally* do a big 'how to' msg but all this IS answered in the
readme and the faq.

If the Star raiders is a single file rather than a full disk atr then
its very easy to load them. Tbh its soo easy to use the emu....

Tis not a dig at you but it *is* all answered in the zip file you
downloaded...

: They were unhappy of the situation there, as their names were never
: mentioned on the cartridges, manuals or boxes...They founded Activision
: for more recognition and borrowed some game ideas from Atari.

I seem to recall that during the early 80s, when Activision was very active in the 2600 market, the TV commercials would usually mention the programmer who designed the game -- David Crane, Larry Cartwright, etc.

Atari certainly frustrated its share of programmers -- if they were not credited, they would also leave over creative differences. The only one I can think of off-hand is the case with Ed Rotberg and BattleZone, something about the game being made for military use, and changes to reflect their needs. I am assuming he had no say or was forced to make those alterations. I remember that ABC News even profiled this souped up game (which cost around $30 grand or so) in a segment on the Army's training for combat.

4441. 800/xl audio questions....

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-25 00:00:00 UTC
From: abaddon88@aol.com
Message-ID: <19981124223910.10837.00000342@ng-ca1.aol.com>
Source record: 58108

Hey guys, I was the guy who asked about the monitor pinouts for a b/w monitor. Well I got the video part of the cable working, but now I have an audio question. I set it up so I could plug pc speakers into a female audio plug attatched to my homemade cable. Well with the speakers cranked it's kinda quiet. I tested my cable by patching it into the audio input of a commodore monitor, and it sounded great.(No I don't want to just use the commodore monitor :)). Do PC's send out a louder signal? Should I build a little pre-amp? Any suggestions at all?

Thanks atarians!

>Trystan

Don't know about the fireworks (ATARI couldn't have been THAT cheap), but I'd unplug it from the mains anyhow. It will reduce your electric bill. Unless there is a switch on a PSU (and I haven't seen an ATARI that has one), it will keep using energy.

I have two boxes full of New Computer Express magazine to give away to
anyone who wants them (they were given to me).

As they start from 1988, they offer an interesting and informative insight
into computers the UK then.

Due to the weight of the set, I suggest that anyone who wants them should
e-mail me first at brian@spheroid.demon.co.uk to make arrangements to
collect them (from Cambridgeshire).

This will have to be in early December as I shall not be available to hand
them over until next week.

Alternatively, I don't mind arranging shipment for just the price of the
carriage charge.

Well, I still have my 800XL that I got in 1985, its in great condition. About every 4 years or so I've had to take it apart and clean the keyboard parts because keys stopped working. Its never gone unused for more than half a year or so.

heh, one time my brother spilled water on it, I just used the blow dryer on it for a minute and there was no damage.

Hi!

I have a new version of my 6502 crossassembler available.
Major improvement is the label crossreference list - you can switch
on writing a list of filename/line pairs for each label used to
the labelfile.

In addition to that it already supports a native relocatable fileformat,
linker, relocator etc.
A loader for the relocatable format in 6502 assembler comes with it.

And: it's GPLd, i.e. Open Source (although this bagful of hacks
called "xa" should probably not opened up that much... ;-)

http://www.tu-chemnitz.de/~fachat/8bit/cross/xa/index.html

Have fun

I got Atari 800 in 1982. It got used heavily for nine or ten months a year until about 1991. Between then and about six months ago, it got used heavily for a week or two about every six months or so. Now I'm getting interested in my Ataris again, and I usually at least turn it on every week or so, just to keep it in shape.

I've never had a single problem with it, despite it being UPS-ed 7200 miles during my college career.

nbs@sonic.net (William Kendrick) writes:

: I just hooked up my SIO2PC cable to my "new" Pentium PC (I only had
: some XL's and my old crappy IBM PS/2 8086) and tried out "femul" (aka
: SIO2Linux) by Preston Crow and Pavel Machek.
:
: It worked great! (One thing I had to change was to force it to look
: at my #1 serial port ("/dev/ttyS1") since by default, it looks at #0,
: UNLESS the "/dev/mouse" mouse device is symbolically linked to
: "/dev/ttyS0". Well, mine wasn't, it was linked to something
: differently-named, but obviously the same.)
:
: Anyway, for those of you who have Linux (I'm using RedHat 5.1 on a
: Pentium 133) try it out with your SIO2PC cable! (Note, I haven't done
: much testing... just booted MyDOS and ran "fujispin") No more need to
: install a DOS partition or run "dosemu" or have a 2nd computer around.
: (I'll be SO happy to get rid of that damned 8086.. it's ugly,
: unreliable, and weighs a TON!)
:
: http://atrey.karlin.mff.cuni.cz/~pavel/atari/
:
: Thanks Pavel and Preston! (And of course thanks again to Nick Kennedy
: for the idea to begin with!!)

You are quite welcome!

I have another version of sio2linux that someone else has done based
on my work. I've been meaning to look it over and update the version
on my page accordingly.

I have several tools for manipulating binary load file and disk images
that are also of interest to people running sio2{PC,Linux} or an
emulator:

http://www.cs.dartmouth.edu/~crow/atari/

Enjoy!

I know most of the group does not know Lance of Video61, but just to enlighten you a little. He has supported the Atari 8-bit community for many years since the early 80's and it is his sole income. He has items not available else were but still available.

He would not go to an IBM platform to support our needs, stayed dedicated to the Atari 8-bit, even though he could not reach many users. WebTV came out and he finally relented, purchased the darn thing and is now available, support him as he has in the past and will in the future support you and your computing efforts. He doesn't handle vaporware, and has programers ready to take on a challenge, and produce.

I know of a few projects they are working on and you as the Atari community will welcome the new products. I released BBS Express! Professional to Lance as I know he will modify it to your benefit.

But don't sell him short here, as he is/will be working on new items to benifet all, myself included.

bob

Your problem lies within the RAM! You can send it off and have it fixed or you can attempt to do it yourself.

1.Dissassemble the computer take it down to the board, place the motherboard into the plastic case. Plug in the power and wait a couple minutes. Run your finger down the 8 Ram Chips, which are on the left hand side of the board, 4164.. Find the hot ones by touch, replace these and you will be back up.

If you do not wish to do this I can send you a working board with shield for $14.00 shipped when I recieve your old board.

In packing to move after 12 years in the same place, I uncovered my Atari 800 (128k or 256k) system... in working order. Peripherals include an Atari "data" cassette "recorder", Atari 1050 drive, 2 Rana diskette drives, a stack of software diskettes, books, joysticks and cartridges such as Pac-Man, Asteroids, Centipede and Basic. Diskette software include "Music Construction Set", "Seven Cities of Gold", accounting software, personal information software, "Zaxxon", and who knows what else. The system works just as it did a decade ago, though I have not tested ALL the software diskettes. Was going to throw it all out... until I stumbled onto this newsgroup.

How much do I want????? A small donation to a charity of YOUR choice (or I can suggest one). Giving and receiving are 2 sides of the same coin... and whether you make that donation or not is your own business. Honesty... the only way!

I am located in the Burbank-Glendale-Pasadena area of So. California. If you are located outside of this area or in another country, we can work out a way to get any of this to you. I'll get a more detailed inventory of this "stuff" over the upcoming 4 day Thanksgiving weekend.

no, the SLCC thing was an internal hack for 80 columns.... was very cool -
synched to the Atari screen as well as TTL output. very fast, not like the
XEP80. you could write a full screen of data in one frame or so - about 1/30sec.

had its own memory too.... 16K if I remember. used NO Atari memory.

the MIO? It's a card that plugs into the MIO board and outputs 80 col video thru a 9-pin connector on the main board. It uses the E: handler, I think. Has its own memory and character set ROM on board.

Try downloading the mydos ATR and using it to boot from. Dos 2.5 will not
work with large ATRs.
I have found Mydos very compatible win WinAtari.

The DB-9 is the modem connection. You should also have a DB-15 for
the printer and a 50 pin SCSI connector.

On Wed, 25 Nov 1998, Jeffrey S. Jewell wrote:

4474. Connecting Atari Joysticks to PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-26 00:00:00 UTC
From: Emmanuel Fernandes <manu@ifdh2.sc.ucl.ac.be>
Message-ID: <365D31E4.B4001F0A@ifdh2.sc.ucl.ac.be>
Source record: 57942

Hi Everybody!

Does anyone know if there exists somewhere in the Net any electronic devices which give you the possibility of connecting standard Atari Joysticks to the game port of the PC ? I have seen Rob Funk stuff about such a device (quite old : 1984) but the are errors in his device and it doesn't work. I am asking this question because I designed my own device using some ideas in Funk's device. It works GREAT, and it is much simpler than Funk's one. I used it to play, with any Atari 2600 and Atari 8bits emulator which supports PC Joysticks, all the classics games on the PC with the real controllers ! What it is also interesting is that you can even play standard PC games on your PC with Atari Joysticks !

If anyone knows about some device (not Funk's one), I will really appreciate the information. If anyone is interested in my device, and can give the schematics !

Bye,

Emmanuel.

What are the main differences between the
Turbo 816 and the Sweet 16? As I recall, the
T816 included a new O/S to take adavantage
of some 16 bit ops. But I also heard that the
S16 used a couple of PLAs to reduce the
number of components? Our user's group
had a demo to the T816, and at that time I
couldn't see any particular advantage to
buying and installing it. I was going to buy
a S16, but decided that I'd wait until they were
really in production.

Both the units have the modem connector, but one has an additional db-9 in the VIDEO position. It's this second db-9 I'm curious about.

Thanks for the response, though.

That's where the 80 column upgrade would have gone if ICD ever got it to work. The MIO without the connector is probably a later model after they gave up on the idea.

4481. HELP!:800xl

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-26 00:00:00 UTC
From: Jason <jason@datascan-inc.com>
Message-ID: <365DC488.671F0306@datascan-inc.com>
Source record: 57949

Hello all my Atari friends,

I was in a junk store about a week ago and ran across 1(600xl),1(800xl), amd 2 1200xl's. Plus 14 various carts and some printers that work great after a good cleaning. I got them all for $7 and took them home.

All of them work but listen to this, I made a DIN power plug for the 600 and 800xl (5volts needed) and took one of my old PC power suplies and hooked it up and BOOM, they both work great.

Well, stupid me, I took the 800xl apart and was cleaning up some old dirt and rust inside. I hooked up the power again but this time instead of the +5v I did the +12v.

Now I only had it on for about 6sec's before I relized my screw up and turned it off. The memory chips are insanly hot. After a cool down, I hooked back up to 5+V's and no display but the memory chips still get HOT to the touch.

I do know quite a bit about electronics and have many IC ref. books. Does ANYBODY know if the mem chips are suposed to get 5+v TTL to them. That's what I'm getting right now. I was thinking about using the chips out of the 600xl to see if that works. All the other chips, CPU,ANTIC etc. just get alittle warm and is drawing normal current.

Or has anybody done this before and recovered from it?

Any help would be apriciated.

Thanks,
Jason

(Pacman.exe won't load with emulator.)
I don't think pacman interferes with DOS. But many '.exe or .com'
files must be loaded using a boot loader disk. ie. You'd have
to copy these games onto a boot loader disk, then boot that
disk and load from there.

Well, I'm interested. I live in El Segundo, CA (just about 25 minutes from
you), and would have no problem driving out there to pick it up. And I also
have a few charities in mind for donations as well - which is really a nice
idea BTW...

4484. JAM arrived (finally)

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-26 00:00:00 UTC
From: nbs@sonic.net
Message-ID: <73kict$ar0$1@ultra.sonic.net>
Source record: 57952

I made the mistake of forgetting to include my apartment number when I ordered my JAM (either that or the folks at AIMSLab screwed up).

Anyways, a week and a half dozen calls to UPS later, it arrived!

I got my PlayStation atop the 1050 atop my Linux PC and it works great.

Now I need to figure out how to get my 800XL to talk to it (it almost worked for a sec. when I hooked up plain composite :) but the image then vanished and I was back in Linux. :))

Anyway, it's a slick little unit. (A little too light for my tastes, for some reason.. feels extra empty :)). It's about the size of a ZIP drive, and can even sit on its side like a ZIP... in fact, my JAM is right next to my ZIP.)

One thing I wonder, and perhaps someone here can answer... would there be anyway I could switch between PSX and Atari 8-bit without rewiring every time?

Hmm.. I didn't think so. ;)

Anyway.. it's a keen little unit. Worth the $80 (or $70 if you get it around here ;)) to be able to hook up all sorts of non-PC things to your PC monitor. :)

Oh... and realizing there's some hacking needed to be done to get full video going from an XL or XE into a JAM, perhaps a little "HOW-TO" or "FAQ" doc. from Bob Woolley or someone else familiar would be nice..? :)

(Not that I especially need it, since my 1200XL has SuperVideo... Except, right now it's "in the shop" :))

Anyway, thanks! :)

-bill!

> The best is
> 100 close #1
> 110 open #1,4,0,"K:"
> 120 get #1,x:rem the computer will stop everything here until
> a char is read in, rather than cycle thru like the ibm/c64.
> 130 char=chr$(x)
> 140 print (Opps, above should be char$ and a dim char$(1) at beginning of prog.)
> 150 print char$;
> 160 close #1
> 170 rem or something like that

Oh, god, and I thought C-64's Basic was shit...
on C-64 I always do:

10 get a$:if a$="" then 10
20 print a$: goto 10

basta.
I could also use a WAIT instruction on C-64 to stop the program until key is pressed (you mentioned that cycling above).

Ok, just my 2 cents.. not to offend anyone.

Actually, there's an internal header where the 80-column device would have
plugged in. The second db-9 was the actual video connector.

The S16 is a 65816 on a pcb barely larger than the chip, with a single chip (possibly a PLA, I don't recall) mounted on the underside. By cutting out the center spacer on the CPU socket, it plugs in (barely). There was no revised OS; only a copy of John Harris' assmebler was included. Heck, I didn't even get any docs (bought mine at the TAF Atarifest, just as manufacturing was completed)

I have an early version of the Turbo816 (it sez here 1.2M) that's a board about 2" by 5 1/2" in heat shrink, with a ribbon cable/connector to plug into the CPU socket. I *really* need to sit back down and hack on this, but I remember the Bios had a nice "break-in & hack" feature, kinda like OmniMon.

I never did get any of the software, tho...

I don't suppose Chuck Steinman is out there, and willing to drop some of that old software and firmware into PD, would he?

Is there an internet resource about the different varieties of Atari power supplies? I have no idea what makes me notice these things, but I've got 3 different versions of an ~2x2x3 inch power supply with both cords coming out the same side (one of these specifically says 400/800 computer system), 3 different variations of a supply about twice that large with one cord coming out either end, and one example of a lovely power supply in XL beige and brown.

Anyone else notice these things?

Jeff

Chris Crawford is the king of Atari Programming! :)

I know he also worked on a funky game called GOSSIP, and went on to do some really good (and not so good) PC games. I had the original APX Eastern Front Tape, but have since lost it :(

He also pioneered the Computer Game Developer Conference, and is one of the programmers that was always pushing the edge of game design. I know today that means "how many polygons can I push", but Mr. Crawford was looking for ways to do things no one did before. That's why I agree with Javier when he said doing sequels "wasn't his style"

BTW: If anyone *has* a copy of Excalibur, let me know how much you want for it :)

Thanks,
Steve

Cool. ANALOG published a detailed Star Raiders strategy guide, which, as I recall, was even more detailed that the Academy piece. I myself wrote a piece called "Defeating the Zylon Menace", but never submitted it to ANALOG because they published the other piece. I wish I still had the article...but I lost it somewhere in the intervening years.

I bought an Atari 400 just to play Eastern Front 1941. I got the APX tape version. It was a great game, but I noticed a problem that I was wondering if others experienced. There was a handicap option that one could use to make the game easier to play. However, it would also affect the score. Apparently, you were supposed to be able to turn the handicap off at any time, but I found once I turned it on, that it was set for the rest of the game......comments?

>*sigh*

Yea, I still have that ANALOG article, it was very thorough. I also have an article titled "Advanced Star Raider Tactics and Strategies" from BYTE magazine (1982). This is a very detailed article too, the author included graphs detailing hyperwarp and Ion engine use. If William Kendrick is interested, maybe I can scan this stuff and send it to him. I also kept some magazines that contain early reviews on the game, the very first issue of Electronic Games and a BYTE review both from 1981, these just gushed over the game. Maybe Bill would be interested in these from a nostalgic point of view.

I wrote a review a couple years back for Atari Classics back on CIS Atari 8 bit forum. I also started writing an article where I stole the military term HOTAS (hands on throttle and stick), I changed it to HOKAS- Hands on keyboard and stick. It was method of playing the game where one hand was resting on 3 keys (Target computer, Hyperwarp and Manual Target selector) and the other on the joystick. You could play almost the whole game like this without looking at the keyboard, just by position I could move to the Galaxy chart, Front view and the main ION engine settings that I used (5,6,7). Toggling the 'T' and 'M' gave me control of when and who the target computer tracks, it had a bad habit of switching views at worst the times, like when fighting Zylons in front and back.

Man, I used to be into that game.

Dave

Howdy !

Da mein geliebter 130XE kaputt gegangen ist bin ich nunmehr auf der Suche
nach einem gut erhaltenen 130XE. Er sollte am besten eine Speicher-
aufrï¿½stung auf 320K haben, ist aber nicht notwendig.

Zubehï¿½r brauche ich nicht. Macht aber evtl. trotzdem Angebote.

hoffentlich bis bald

-thomas

request my public key. ....Sturz des Zaren!

>#160 error "Drive number Error".
>
>I'm using the DOS_2.5 os and the ATARIXL.ROM.

Right, have done exactly as you have and all is ok, not got the
pacman.exe but quite a few others and they work fine.

I'm also using exactly the same config.

Lets just make sure that all is the same.

You are setting the hard-disk option under the Atari heading to point
H1: to where your exe's etc are, if you don't browse to where those
files are so you can see them in the selector then probs will happen.

From there its boot D1: up with DOS2.5 and then use the L command with

H1:filename

Apart from that BASIC is normally OFF and that should be the it.

Only 2 possible problems I can think of. 1. your images are corrupt 2.
Atari800win is corrupt

I presume you have the latest DirectX installed (can't remember if it
needs 5 or 6). You can send the images you have to me so I can test
those on my system if you like?

I have an Atari 800xl with 1050 disk drive, tape drive, some carts,
around 40-50 disks(various) many books and 2 controllers. All hookups
and cables are included.

I wish to take offers until 12-10-98
who ever has the highest offer will get it.
I'm in Indiana and the buyer will pay for s+h.

If you you have any questions of any kind, please feel free to email me.

E-Mail me at Liberator@acsplus.com

Thanks,
C.T.

Just an observation, not a rant....

If you want to respond directly to a person's news posting-- let's say a response to a "For Sale" post, Please reply to that person via email, not through the newsgroup.

I don't know what the AOL newsreader looks like, but on Netscape, you have the option to reply:

to Sender Only ...or...
to Newsgroup

Besides, it protects your privacy :)

Thanks,
Steve

4523. Re: Atari Basic

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-27 00:00:00 UTC
From: Wes <wrh1@doc.ic.ac.uk>
Message-ID: <Pine.LNX.3.96.981127114022.7759A-100000@pinga.doc.ic.ac.uk>
Source record: 57974

Hi everyone!

Whoever would have thought getting a key in Atari Basic would be such a hassle... just to clarify a few things that have been said, and give some more details on how it works...

About PEEK(764) - this stores a kind of scan-code (NOT an ASCII value) for the last key pressed. 255 means there hasn't been a key pressed yet. After you press a key, that key's value remains in PEEK(764) until you press a different key, or you do POKE 764,255.

<vague_speculation>

I believe there is a conversion available from the scan-code into ASCII, but I need someone with 'mapping the Atari' to tell me what it is - it's something along the lines of:

SCAN=PEEK(764): ASCII=PEEK(PEEK(190)*256)+SCAN)

although that really is stretching the memory a lot, so the 190 is probably not correct!

</vague_speculation>

OPEN #1,4,0,"K:":GET #1,A:CLOSE #1 - this kind of thing physically stops and waits for a keypress, but it does have the advantage of returning you an ASCII character, which is a bit easier to deal with.

So, combining these, if you've got a loop running where you want to retrieve characters while you do something else, then this will work.

```
10 L=0
20 A=0
30 IF PEEK(764)<>255 THEN OPEN #1,4,0,"K:":GET #1,A:CLOSE #1:POKE
764,255
40 IF A=ASC("A") THEN PRINT "YOU PRESSED A!!"
45 IF A=ASC(" ") THEN GOTO 70
50 L=L+1:IF L>10 THEN L=0
60 PRINT L:GOTO 20
70 END
```

Basically, this will continuously count up to 10, mentioning whenever you press the 'A' key, and exiting when you press the space bar.

Hope that's helpful - lots of people have suggested lots of answers, so I hope this gives a bit of an overview on all of them. If you were, of course, to use Turbo Basic, then not only would you end up with a pretty quick basic system, with a good compiler, but you'd also get a GET$

command! :-) (Available from New Atari User's p.d. library, and probably elsewhere as well)

Oh, a quick snippet as well... I think you can do POKE 731,1 to get rid of the clicking noise when you press a key, which is useful if you're writing this in a game loop...

Oops, sorry. If I remember correctly, you put the ROM code somewhere (but I might be wrong). So I thought you also wouldn't be against it, if we'd built it into our 1050's. And for that you not only need the ROM code, but also the other chip, which I believe to be RAM.

Sorry.

CU Mathy van Nisselroy

PS I picked up my education (most of my student friends are 10 years younger then me) so I have barely enough to buy small stuff for my computer.

I have the original cart, as well the cart for the xe game machinne, i can send you one for free if you pay the post, i also can send you a copy of the manual. I don't think that Chris Crawford made a sequel of this game, i mean it wasn't his style, the games that i know he wrote were Eastern Front 1941, Excalibur, does anyone has a copy in atr of this game??? , Tanktics and Legionnaire, don't know if i spell it ok. He also wrote a couple of books. He was the best Atari Programmer ever.

Javier.

Pd: I live in Mexico City.

Actually in the final production run of the 130XE, there
was a revised OS made. As far as I know, the only difference
is a revised diagnostics that has a keyboard test that matches
the XE keyboard and full 128K ram test.

That revised OS has been known to be incompatiable with a
program that is used by cable companies for marquee purposes.
I have one in my 1400XL and haven't had any problems yet.

To anyone:

I am looking (or should I say have been looking for some time) for an
Atari 400 system, complete with a power supply and the BASIC cartridge.
I am seeking the 410 tape drive as well and some game controllers.

If anyone has a clue where I could find these or if you have one you
want to sell, e-mail me at CLINETO@YAHOO.COM.

Thanks,

Todd

4543. Re: Atari Basic

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-28 00:00:00 UTC
From: brix@NOSPAMplush.de
Message-ID: <MPG.10c966e6b6838de998977e@news.uni-x.net>
Source record: 57911

In article <Pine.LNX.3.96.981127114022.7759A-100000@pinga.doc.ic.ac.uk>, Wes (wrh1@doc.ic.ac.uk) says...
> Hi everyone!
>
> Whoever would have thought getting a key in Atari Basic would be such a
> hassle... just to clarify a few things that have been said, and give
> some more details on how it works...

Well, each sytem has it's disadvantage. For example locating the cursor for the next Print instruction needs 2 pokes on C-64's Basic, while on Amstrad CPC you have the LOCATE X,Y instruction and Pascal-language has the GOTOXY instruction.
Just curious - is there a LOCATE instruction in Atari Basic? I think I remember something like this.
What I always liked was that the Atari had LOTS of colours.

Some questions to the Atari-Crowd (I always like to learn about Atari 8 bitters):

How is the Screen built in Textmode? On C-64 we have a $0400 byte area,located at Adress $0400-$07f8, called the Screenram, where we have Screencodes representing the characters displayed.
Where are the bytes that toggle Background and border Color?
Setting the Border and Background color on C-64 can be archieved by just storing the Palette-Value into $d020 and $d021:

```
lda #$02 (color 2 = red)
sta $d020 (store into Border-color VIC-Register)
sta $d021 (store into Backgr.-color VIC Register)
```

Is there a register that tells you the y-position of the Rasterline?
On C-64 we can wait for a rasterline (e.g. $80) by simply comparing with $d012:

```
LDA #$80
.loop CMP $d012
BNE loop
```

Lots of questions...

```
> 30 IF PEEK(764)<>255 THEN OPEN #1,4,0,"K:":GET #1,A:CLOSE #1:POKE
> 764,255
```

Looks way better to me.

> Oh, a quick snippet as well... I think you can do POKE 731,1 to get rid
> of the clicking noise when you press a key, which is useful if you're
> writing this in a game loop...

This click always caused a special type of mood when typing on Ataris.. I liked it, although I think all-time Atari users get annoyed by it after a certain period of time. :)

4544. Pooldisk Too - over 5000 public domain/PD disks and more on a Double CD for $20

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-28 00:00:00 UTC
From: ernest@wxs.nl
Message-ID: <3660219a.20149764@news.wxs.nl>
Source record: 57912

In October 1995, we released the Pooldisk CD. It contained
over 2300 disk image files in the ATR format. The disks were also on
the CD in the XFD format. The Pooldisk Too is a double CD. Some
people helped us obtain more disks, and so we were able to fill an
entire CD with ATR image files. We had to drop support for the XFD
format due to the space limitations. This is only a problem if you
are using a program that supports nothing but XFD files.
You would need to use one of the converters that is on the CD.
On the CD you will find disks from these well known sources:
ABBUC 871 ACE 341 Analog 53
Antic 104 Belgium 88 Bellcom 967
BRE 60 C & T 113 Colonia 61
CSM 56 Demos 45 Flop 26
Futura 46 Haps 820 Internet 35
strange Invasion 16 KE-soft 24 LACE 128
Manosky 40 Mega magazine 16 Misc 289
PAGE 6 29 PD mag 66 Pokey 125
SAG 221 SCAT 209 SEX 37
SPACE 100 STack 86 Thunderdome BBS 330
Top mag 85 Twaug 58 Umich (1995) 454

The directories below contain less than 25 disks:
Atari Classics, AMC, Atari Dos, Bpaug, Brace, Bradford, DOS, Elfin,
Hac, HTT, Ol'hacker, PAC, PACE, R-Atari, Starbase.

Several commercial titles from A New Generation software were put on
the CD by permission of ANG with a restriction from copying them.
The mega magazines and the Pokey material have the same restriction.

This all adds up to well over 6000 ATR files. Now since some
libraries are (almost) completely on the CD, some disks are bound to
be duplicated across libraries. We included them anyway, just so you
have the libraries as complete as currently possible. I think it is
reasonable to assume that there are over 5000 different ATR files on
the CD.

The second CD contains various utilities and fun stuff for use on a PC
or platform other than the Classic Atari, but very much related to it.
You will find over 100 Internet sites, varying from simple home pages
to elaborate sites. You will also find about a year's worth of
messages from the Use net newsgroups rec.games.video.atari and
comp.sys.atari.8bit, and messages from the abbucnet and assembler
SIGs. These are in the QWK format, so that they can be read with a
QWK offline reader. Furthermore you will find information related to

the Jaguar. Some stuff for use on an Amiga, Atari ST and the Apple Macintosh. The text of the well known book Mapping The Atari by Ian Chadwick is on the CD, by his permission, with the restriction that it is not copied.
We have collected various avi and movie files, and put them on this CD too. These are huge, so no more download time, and fun to watch.
Various utilities and emulators for the PC can be found on the CD. These emulators also make use of the files in the ATR file format. The current versions of SIO2PC and APE can be found here, and emulators like Atari800Win, XL-it!, Xformer, Rainbow, Pokey, and ACE. Converters like Imagic and Diskcomm and XFD converters.
About 1000 pictures of various Atari equipment, collectibles, cassette covers, flyers, schematic diagrams, and the occasional Atari lover.
Lots of text files with information and documentation. There are lots of XL files that we did not put in ATR image files. One reason is that we did not have the time to do it. Another one is that the files are subdivided into sub-directories and putting them into ATR files would result in lots of ATR's with a small number of files, or ATR's with multiple unrelated files. The Umich archives from 1998 are therefore also on the second CD, not in ATR files. We did convert the archives to uncompressed format though.
Finally, the second CD contains a 20 megabyte directory listing of all the ATR files that are on disk one, so if you are looking for a specific file, you can search this listing to find the ATR disk the file is on.

You can order this double CD by sending a check or money order drawn on an US bank for US $20 to me:

Ernest R. Schreurs
Kempenlandstraat 8
5211 VN Den Bosch
The Netherlands

Include a note telling us the shipping address. The US $20 includes shipping by airmail. If you live in Germany, you can also order the CD from the ABBUC user group. Take a look at this URL:
http://www.atari-computer.de/abbuc/

For more information on the Pooldisk Too, take a look at this URL:
http://www.xs4all.nl/~stack/atarixle.html

If you have any questions, you can send me E-mail at ernest@wxs.nl

Keep those XL's/XE's humming!

4545. Re: Cart reader!

Are you talking about Atari game cartridges or things like OSS MAC/65?
There's a big difference in that the OSS type allow access to DOS and
can easily be saved to files. Boot cartridges are another story.

Saving an OSS-type is easy; using the saved file is not as you have
to implement some kind of software emulation of the bank switching.

If you can't find one there is another option: Radio Shack used to
sell a DIN-to-RCA jack adapter that would plug into the monitor
port and give you four RCA plugs (Comp, Chroma, Luma, and Audio).

I don't know if they still have them so I guard the ones I have
rather jealously.

I've started an awards system, but so far I've only receieved
nominations from STers. Stop on by and make some nominations for the
8-bit machines. There are currently three categories:

code.STAR - Awarded to Individuals, Groups, Organizations or
Companies whose programming efforts, both historical and
current, have impacted positively on the Atari
community.

service.STAR -Awarded to Individuals, Groups, Organizations or
companies whose non-programming efforts have contributed
to the knowledge, perpetuation or Espirit de Corps of
the Atari community.

site.STAR - Awarded to Individuals, Groups, Organizations or
Companies shown to be willing to invest time and effort
to provide a valuable web-based resource to members of
the Atari Community.

Please stop by and make an effort to recognize the people that help
the Atari world thrive.

Bill, glad to see you back!!

Easiest way, get a RCA cable splitter, and plug the PSX and Atari into the splitter. Problem is that you can't have them both on at the same time.

You could go to Radio Shack, buy a switch, experimenter's box, and some RCA jacks, and build your own switcher. You could add more inputs, so you could hook up other video games!!

Now that I think about it, there was an Antic or Analog article on using the Atari to control a Laser Disc player. In that article, they build an automatic switcher to change the input to their monitor from the Atari and the Laser Disc player.

Later...

Legit? Hey, Pool Disk One has enough software to keep filling up my
club's newsletters for the next ten years. We're very happy with it.
Pool Disk Too will have all that and a ton more! The Schreurs brothers
have done a fantastic job. Our order is in!

Actually, it's twice as good! Two disks instead of one. :) I
just received it. Bo and Ernest have outdone themselves. This was
defnitely worth waiting for! They ship promptly and they can now accept
checks in U.S. dollars.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

<sigh> Well, I wish it was! I've been thinking about ways to get it on the 'Net but... ;-)

The BBS software itself does not support it, so thats out. I refuse to use anything non-Atari, so thats out. I've been thinking about picking up a TT with its multiple serial ports, then if I could get an ISP to cooperate, use Mint, grab a permanent IP address, and let users logon to there, then use something like CU to call the BBS... Of course this means I'd have to pickup the TT/monitor/2 more modems/2 more phone lines... ;-)

Still, I'd just love to do it!!! <grin>

Hmm...somebody help me out here, but aren't there versions for the:

2600 (consoles)
800XL (8-bit)
ST (16-bit, but runs on Falcon, HD)

This is open to debate, but IMHO...the ST version has better graphics,
works on the Falcon, and runs from a HD. However, I feel (along with a
lot of others) that gameplay on the 8-Bit version is superior... ;-)

In order of appearance (I think)

* Original 8 bit version for the 400/800/XL/XE series computers-
The first and still the best version in terms of gameplay and
challenge.

* 2600 VCS version with separate keypad controller-
Simpler version graphically and gameplay wise because of the limited
VCS hardware.

* 5200 Version-
Basically the 8bit version, with some very minor graphic enhancements
(you could see the ship type in the long range scan, the original just
showed a blip)

* Star Raiders II for the 8bit computers-
More of a sequel than an update, it was an interesting game with
somewhat better graphics, but still not as exciting or challenging as
the original..

* Star Raiders ST-
This version had beautiful graphics, but that was about it. Gameplay
was very poor, downright boring, and the sound effects were awful.

Again, no contest when compared to the original.

* Star Rangers for the PC-
I'm including this even though it's not a true version or sequel. Interactive Magic's Bill Steally (Microprose ex president) said Star Raiders was one his all time favorite games and an inspiration to get into the industry. Star Rangers was his 'Ode to Star Raiders', and actually is pretty faithful to the original game concept. It didn't do well in the saturated PC market, but if you were a SR fan it wasn't bad. You can pick it up in the bargain bins for about $5 now.

Vaporware versions-
Star Raiders 2000 and Battlesphere for the Jaguar

I think if you polled any Star Raiders fan who has played all of these and asked which was his/her favorite, I think the response would be pretty unanimous that the original was and still is the best version ever.

Dave

This sounds more like legitimate grounds for contacting one or more attorney generals than any sort of civil nonsense. Really, what's the difference here between Hohman and Ortman? Both have taken money, and not delivered on product...

Jason

Yep, I DO!! and I want him 3D, like Montezuma's revenge 3D!! ;))

Actually saw that as low as $20 yesterday, but had to get tomb raider III
instead...

I would like to see a 90's version of star raiders, similar to the
battlezone release earlier this year.. centepede looks interesting, but I
think they might have missed the ball on the new asteroids.. it should have
been a full 3d game, like the asteroid sequence in empire strikes back...

Hello,

Wasn't there a Star Raiders for ST? Does anyone have any screen shots
on any web pages or any info. on it? Also too, I remember an old ANTIC
article that had STrek source code. I tried to convert that to my 8-bit
a few years ago but dropped the project.

Anybody have any info on THAT game (in other words, did any one type it
up and play it?)?

Laters,

antbaker@arn.net

The original for 8-bit was the best and revolutionized the gaming world
(think about it, all first person, 3D, and flight game run on the basic
concept of SR). If you think about it, you can see it in even todays
games (look at Decent...it's like a re-vamped SR).

Something interesting that I noticed when I remembered my old 8-bit
games. Wasn't SRII re-named The Last Star Fighter based off the movie?

Reason why I was wondering is because I have the "SRII" game but it's
named "The Last Star Fighter".

I got the ROM image for the 1090 SALT cartridge and disassembled it. It
looks like it uses $D1FE to bank select a window that starts at $4000.
I'm not sure how big the window is.

As soon as I slap my emulator code around some more, I should have a better
about how it works.

Jason

Opening bid is 0.01

Here is the chapter outline of the book :

Contents

Preface v
The Atari Machine 9

Part I. Atari Graphics Tutorial

How a TV works 13
Character Generation 15
Dot Graphics Line 17
ANTIC and CTIA 19
More Memory Secrets 21
Examining The Display List 23
Modifying Display Memory 24
Display List Opcodes 26
Notes & Discussion 27
Basic and Color 30
Display List Interrupts 33
Player-Missile Graphics 39
Character Sets 46

Part II. Graphics Tips

Design Philosophy and GTIA Demos 55
Graphics Seven Plus 59
Player-Missile Design Aid 64
Animath 67
Greater Graphics Control 71
The Atari Graphics Composer 73
Artifacting With Graphics 7-Plus 74

Part III. Hardware and Software

Bits & Bytes 81
Physical Types of Memory 83
Atari Music Composer 85
Compuserve 86
Build Your Own Light Pen 89
Atari Silencer 93

Basic A+ 95
Monkey Wrench 97
String Arrays 98
Talk Is Getting Cheaper 99
Axlon RAMDisk 103
Joytricks 105
New RAMS for Old 109
K-DOS 111
Keyboard for the Atari 400 112
The Mosaic 64K RAM Card 114
Atari 1200 116
Letter Quality Alternative 117
Atari Word Processors 119
Atari Text Editor Program 122
VisiCalc 123
Atari Resources 125
Questions & Answers 126
Atari Languages 129
Getting Along Without TAB 132
Telecommunications & Memory Locations 133
The Upstart Atari 135
Self Modifying Programs 138
Super Text Mode 141
Neater Numerical Tables 147
Interfacing Your Atari 149
Atari Strings and Text Handling 152
An Atari Library of Sound 153
Original Adventure in 32K 156
From Burn-Out to Born Again 163
Speedread + ... 165
Eastern Front 166
Missile Command & Asteroids 168
Star Raiders 170
Basketball 171
Warlocks Revenge & Kayos 171
Gamma Hockey 172
The Wizard and the Princess 173
Graphics Adventures on the Atari 175
Cypher Bowl & Krazy Antics 178
Not Just Fun In Games 180
Deluxe Invaders & K-Razy Shootout 183
Dog Daze & Caverns of Mars 184
Canyon Climber 186
Clowns & Balloons 186
Pool 187
Nautilus 188
Shamus 189
Miner 2049'er 189

Part IV. Disk Drive Tutorial

Atari DOS 193
Atari Diskfile Tutorial - Part I 196
Atari Diskfile Tutorial - Part II 198
Atari Diskfile Tutorial - Part III 200
Using Disks With Atari Basic 204

Part V. User Programs

Mazemaster 209
Monster Combat 215
Scurry 225
Collision 228
Air Defense 230

Appendix

Atari Memory Addresses 237

It looks like a very informative book, I hope somebody will enjoy it.

The Last Star Fighter was one of those loose ends from the old Atari (pre-Tramiel) that never saw the light of day (except as a bootleg, of course). I remember that Atari felt the "Star Raiders" name would be a stronger selling point for the game, so they made some tweaks and added few other things to make it easier to play (in LSF, you had to go to a star to regain your energy -- very dangerous if you stayed around too long!).

SRII is certainly flashier than its predecessor, and had better graphics and cool explosions, etc., but it lacked some of the spark and required strategy thinking that made the original fun and challenging.

Yea, there was an ST version of Star Raiders. Graphically it was
beautiful, the cockpit was great looking. But that's where it ends,
the rest of the game was a dog. The sound effects were pathetic,
there was none of the strategic planning and thinking required to win
like the original, no excitement at all in the gameplay. Very
dissapointing, I was really excited when I heard Atari was creating a
version for the ST, too bad it was so lame.

I have a BASIC version of Star Trek that I picked up from one of the
FTP sites, I don't know if it's the same one you're asking about, but
it's pretty faithful to the original mainframe version.

Star Rangers is a DOS game and a couple of years old, but I've been running it under Win95 with no problems. Like I said, it's worth getting if you were a big fan of the original (like I am), especially now that you can find it for under $10.

It does have some improvements, you have a wingman to help you out, friendly ships and starbases to protect (of course), and the Taureg's (the bad guys) have capitol ships to destroy. Your ship has a variety of missiles, including tactical nukes for taking out the Taureg Basestar.

It has a pretty cool HUD for tracking targets. Like the original, you have a Quadrant map, and you can warp anywhere there is trouble. And like SR, you have to pilot your ship through warp space, which look like 'wormholes' you steer through. You must manage energy consumption, and of course, when your ship is damaged, docking at your local friendly starbase to get repairs.

The SVGA graphics are decent for the time it was released (1995), but the sound effects are pretty weak. There are 17 missions, but they are dynamic, each time you play them the number and placement of ships will be different.

Actually I would say that of all the clones and sequels I mentioned earlier, Star Rangers is probably the best of the bunch in terms of trying to capture the spirit and challenge of the original.

Hi people.
Anybody need a 410? I have 2 that have loose belts. I also have a 400 in parts with all but the power board. Well the power board is bad.

I would like to trade for a 48k board for my 400. I have a 32k board but I'm greedy :) Or educational games.

Let me know
Thanks
Mark

I shouldn't even be here, but...

No, bad idea. Mike isn't a con man at all, took a chance & circumstances beyond his control took over.

For one thing, just look at the ICD product line he bought. The big sellers were MIO, US Doubler, SDX, PR:Connection. IIRC, what happened was about the same time Mike purchased the rights to these products, the SIO2PC cable came out making 90% of the ICD stuff less then cost effective. Just read the message base, whenever someone talks about storage, 90% of the time the answer is "sio2pc". As far as the PR:Connection, it used a proprietary Rockwell CPU so the idea of doing another production run in the quatities required is out of the question, not to mention a lot of functionallity is provided by APE.

This kind of broke his balls. Would have knocked the wind out of my sails too. Everything he could do, like the carts, SDX upgrade, Action!, etcetera. he did. He just got exhausted by the effort while he was trying to integrate everything into a product people would want & didn't have a safety net for when he hit the wall.

>but I need someone with 'mapping the Atari' to tell me what it is - it's
>something along the lines of:
>
>SCAN=PEEK(764): ASCII=PEEK(PEEK(190)*256)+SCAN)

On XL or XEs only it would be ASCII=PEEK(PEEK(121)+256* PEEK(122)+SCAN)
The 400/800 don't have a pointer, but the table is at a fixed location in
ROM and works
similiar to the XL/XE's -- don't know the address offhand.
Location 53769 can be used instead of 764 if you don't want to put up with
key repeat
delays.

Values 128 and above returned have a special meaning (special keys or not
used)
(These are for the XL/XEs -- 400/800s don't have all of these. Some are not
used in the
default table). Values returned take control and shift into account but not
Caps lock in inverse.

Special values that can be returned:
128 is invalid keypress
129 toggle inverse video (used by inverse key)
130 toggle upper lowercase (used by CAPS key)
131 CAPS lock on (used by CAPS key with SHIFT)
132 CTRL lock on (used by CAPS key with CTRL)
133 EOF (used by CTRL-3)
137 Key click toggle

138-144 1200XL F1-F4
142 Cursor Home
143 Cursor to bottom left
144 Cursor to left margin
145 Cursor to right margin

OK, but I think one of the things Bob Klass challenged was the amount anybody lost to Mike. For instance, if Jason says I ordered xyx for $$$, then we can get a handle on it. I know $1 is as bad as $1,000 but at least we can get some handle on exactly what happened.

If he ordered an Action! cart he didn't get, I will send him my spare to make him happy<ier>. I still have a bunch of sio2pc cables laying around from when I was prototyping them, I will send him one or two of those.

Do you see what I am trying to get at? Resolution so we can move on. Why hold a grudge? There is no reason to fight amongst a fan base, which is one of the major reasons why I left this damn group after my sio2pc/APE cable work.

Giving full credit to Nick for his original work, I would argue that my 1489/75188/14C89 cable designs are by any measure some of the most successful designs for the Atari in terms of number of devices or even dollar amount sold, but the pettiness in this newsgroup caused me to take a multiple year hiatus from it. I do this for fun & a lot of the clowns in here just suck the fun right out of it.

I am really too busy in real life to get back into soldering, but I think I can pretty much put in a few minutes to get things set right.

It never ceases to amaze me how people will hold grudges forever, but will not spend 2 mintutes getting them resolved.

4590. Re: PAL-NTSC Upgrade

No, the PAL upgrade that Nir did was to convert out NTSC machine to run 50hz
PAL software - it did not make our machines into PAL systems. Sorry....

Nir is on this group - scan the messages.

Bob

You can find those just about anywhere these days - including a lot of grocery stores. Just a generic "game adapter" will do the trick (it certainly does not have to say Atari on it, in case that's what you're thinking...)

- Trevor Holyoak

4597. Re: Connecting Atari Joysticks to PC

I saw a web site a year or so ago where I guy was making several
different version of adapters to fit controllers of many different game
systems. He said an Atari one was coming soon, but when I checked back
later, his web site was gone.

I'd love a copy of your schematics, if you're offering them.

Thanks,
Trevor Holyoak

Message-ID: <73qs7u$7d1$2@ultra.sonic.net>
Source record: 57933

Brix (brix@NOSPAMplush.de) wrote:
<snip>
: Just curious - is there a LOCATE instruction in Atari Basic? I think I remember something
: like this.

POSITION X,Y

Moves the cursor to X,Y (be it the text cursor in the normal text screen, or
the invisible cursor in the many graphics modes).

While:

LOCATE X,Y,C

Moves the cursor to X,Y and grabs the ASCII character value or palette
color entry (0-9) at that location and places it in the variable C.

: Some questions to the Atari-Crowd (I always like to learn about Atari 8 bitters):
:
: How is the Screen built in Textmode? On C-64 we have a $0400 byte area,located at Adress
: $0400-$07f8, called the Screenram, where we have Screencodes representing the characters
: displayed.

Similarly, so far. The location of screen RAM can depend on what's already
in memory, so you need to look it up:

SCREEN = PEEK(88) + PEEK(89) * 256

or, in TurboBASIC:

SCREEN = DPEEK(88)

: Where are the bytes that toggle Background and border Color?

Well, in BASIC, you can simply use the "SETCOLOR" command.

SETCOLOR 2,HUE,LUM - Change the background hue and brightness,
and text hue (lame, I know :)).
SETCOLOR 1,XYZ,LUM - Change the text brightness.
SETCOLOR 4,HUE,LUM - Change the border hue and brightness.

Hue values are from 0 (black/white), through 15 (yellow). It goes in more
or less a rainbow fashion:

1 yellow
4 redish
8 blue
12 green
15 yellowish

Lum. values are from 0 (darkest) to 15 (lightest). 0 and 1 are the same,
2 and 3 are the same, and so on.

You can POKE these into memory:

POKE 708 + PALETTE, HUE * 16 + LUM

So to set the border to white, you'd go:

POKE 712, 255

: > 30 IF PEEK(764)<>255 THEN OPEN #1,4,0,"K:":GET #1,A:CLOSE #1:POKE
: > 764,255
:
: Looks way better to me.

I'd suggest dedicating a channel at the beginning of the program, rather
than opening and closing it EVERY TIME. :)

Battle Sphere from 4Play for the Jaguar is due out real soon now
(there have been problems getting the encryption key to make the
cartridges). Star Raiders is given as the main source of inspiration
for Battle Sphere. You might want to check out rec.games.video.atari
or alt.atari-jaguar.discussion to find out when it is finally
released.

(People loaned Mike Hohman stuff, and didn't get it back.)
I remember someone posting here a long time ago that they
saw a ton of A8 stuff in a storage place.
I could imagine the following:
Mike Hohman was pretty broke, he moved a lot of stuff into
storage, but failed to pay the storage fees. Someone or
a number of people got into the storage, as is common
with 'non-payed' storage and tried to find stuff of value,
I believe it was in California, this storage space.
According to state law, I guess a storage owner can
get at people's stuff if they don't pay fees.
Also, someone may have gotten some kind of legal papers
to get at this stuff.
Anyway, my point is, Mike Hohman's stuff may be long gone,
no hope of anyone recovering stuff.

4617. Romper Room love my alphabet program disk

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-30 00:00:00 UTC
From: 8bitz@my-dejanews.com
Message-ID: <73v67hkg1@nnrp1.dejanews.com>
Source record: 57801

Greetings all. To make a long post short, does anyone have a file/atr/pro image of the romper room love my alphabet program? My original didn't fare too well in storage and the commodore side is pitted and I'm worried about it failing alltogether. Every time I load it it seems to take longer and longer and graphic glitches show up. My daughter loves the little ball Max. All my tink tonk programs came through OK and so did juggles and mickey outdoors and spelldiver. UNfortunatly my happy drive is awol so I can't make a copy.. And I never learned how to really use my omnimon (wink wink) for dumping. SO Any help or info would be grreatly appreciated. Thanks Mark P.S. I would be interested in talking to any other parents that think the atari's early educational value is high :)

I don't know if the music was the same but the screen shots I saw looked
nothing like the 8-bit version we all know. While I have not played it
I bet it can not compete with the 8-bit version and two human players.

: thought they weren't coin-ops until right now... :)

Actually, the two titles were original computer games, not home conversions, etc. Computer Games magazine profiled the Lucasfilm programmers and these upcoming games in their Nov/Dec. '84 issue. Part of the article was describing how they developed the games and George Lucas's input for some of the action and story detail. One of tidbits said Lucas wanted "Ballblazer" to be sort of like Monopoly, in which players could choose the kind of "piece" they would operate on the playing field. But the programmers vetoed Lucas (a rarity!) so both players would have the same advantage.

The article also had a photo of the programmers, and among the elite group was an Atari 800 connected to two 810 disk drives and featured the first screenshot from "Rescue on Fractalus."

Also, a year earlier in the same magazine, it said that the much talked about George Lucas/Atari deal (made in 1982) was about to be launched, and that the first game was, as it was referred to as back then, "a futurisitic baseball game." It was to have been an exclusive for Atari computers.

This is getting slightly out of hand.

What can I do?

The source files are just text files, so, once I remember how to copy
them from the 800 to the TT, I can mail them to anyone who asks,
(within reason). What's the position with copyright on APX stuff?

The manual (an APX document) is a little trickier. I have a scanner,
but it's only a hand one. The manual is about 16 pages long, so I'd
be looking at about 50-60 IMG files - a little painful but possible.

No, I don't want to sell my copy.

No I don't have a method for making .atr or .xfd files

Okay just a few quick of thoughts:

1. I have no vendetta for Mike.
2. I never got burned on any money.
3. Anybody can make poor business decisions, or get bad luck.
4. All that being said, it is still somewhat unfair to categorize
people pre-paying for a product or products as if they were in reality
offering venture capital. There is a whole different set of rules and
ethics between the two concepts.

Ok nuff' said.

'ello,

i did a conversion on a std atari joystick to use on an ibm back in 88-91 sometime for a UG member to play pc games on his pc (he like the atari stick better than any ibm one he could find.... basically all i did was cut the db9 off and put a db15 in its place and did a little rewiring and two resistors and a push button in the atari jstick (the push button is for the second button ibm jsticks have on them....) worked great. i did alot of little hardware hacks like this for my UG, i loved doing hardware stuff.... eg: took the box from a jstick and put four leds on it so they could be programmed to do all sorts of things (this was originally a diagnostic tool i built for a networking setup i was going to make using the jstick ports.), built a little circuit board to hook up to an atari and any 120v thing to turn it on and off, built an external keyboard for my 800, hacked a 65xe to be used as an external second keyboard to a 130xe, put a 130xe into an ibm mini-tower case and then hacked a 1200xl as an external keyboard, put am internal printer and serial ports in a 130xe, put an internal speaker and amplifier in a 800xl(one UG i belonged to was donated a monitor that was video only no sound output... so i put it all right into the machine, it was funny this was about '91 the UG was PACS (philadelphia area computer society) and they have sigs for many different machines, the members found out the audio amp chip was part number '386' so when it came time for me to demo the machine i had about 25-30 people wanting to see 'the atari 8bit with a 386 in it...' ;') i also had a few other tricks up my sleeve but this post is long enough :')

sloopy.

4626. trade: Mega ST for 8 Bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1998-11-30 00:00:00 UTC
From: Tony <tony@embeddedmicro.com>
Message-ID: <36622B5D.2C52AEA4@embeddedmicro.com>
Source record: 57878

Is there anyone interested in trading their 8 bit stuff for a 4 Meg Mega ST? The mega works great and had an ADSpeed 16 MHz upgrade installed. This trade would be for the Mega CPU & keyboard only, as I'm using the monitor for my Mega STE.

Tony

The picture quality goes down if you do this though, from what I remember.
Not a great deal, but it's not quite as sharp.

Richard,

It's really starting to piss me off that people are still trying to
defend a CROOK like Mike Hohman. You talk about challenging the amount
anybody lost to him, here's a list:

Atari prototype XC1411 color monitor $250
(2) Atari 1090XL Ram boards $???
Atari Video Music $???
Several Atari PC's $???
Bit 3 80-column board $???
(2) pieces of software $???
(Jawbreaker & Mousekattack)
$100 shipping on 2 different occasions $200

That's $450 in cash plus items thast I lent him, or he owes me for
stuff I traded to him. How do you put a price on those? Are you
willing to make amends on his behalf as you intimated below?
I'd be more than happy to spend 2 months getting this resolved let
alone 2 minutes!

Sorry, but I think I have a right to hold a grudge.

Please excuse the extensive quoting. I wonder if What Mr. Cortese wrote is one man's opinion, or something closer to the facts than that.

I bought an upgrade for the SDX and registered Sparta 3.2F (which got me another copy of the manual) just shortly after FTe's beginnings. They were delivered promptly. I even got a long-distance phone call from the guy! FTe seemed full of promise in those days, but the promises flew so fast that my take on the situation after that was more like Mr. Hohman overextended himself.

It would be sad to have one superb product like SIO2PC (compounded, if you will, by the development of A.P.E.) blamed for what many see as Mike's disappearing with a lot of money and orders that were never filled.

What troubles me more is that I've also heard that Mike borrowed equipment from some people and never returned it. There's no excuse for that.

And now that others are again advocating for legal action, I believe it's time that Mike Hohman, wherever he is, make a statement of intent. We've heard theories of why he went underground. We've heard hints from reputable sources that he will re-emerge when he has something to deliver. Forgiveness and/or retribution are matters for those who have been wronged by him. I'm not in that category, although I see their point of view all too well. But this community needs all of its potential resources and talent.

>Does ANYBODY know if the mem chips are suposed to get 5+v TTL to them.

The answer is yes. You should be getting +5V to the RAM chips. I could be
terribly wrong on this, but I don't know of much of anything internally on
the 800XL that uses the +12V other than the I/O.

>That's what I'm getting right now. I was thinking about using the chips
>out of the 600xl to see if that works.

This probably won't work. The 600XL uses different memory chips unless it's
had some kind of internal 64K upgrade.

Actually,

What would have been nice and I'm really surprised that ICD or CSS or Fine Tooned didn't do this, infact noone did it except Atari who never sold the product was to just come out with an expansion box and then one by one, release cards for it, it would have truly given the hobby a great shot in the arm is like ICD came along, sold an expansion box, then sold a SCSI card, then a Parallel/Serial, Z-80 and so forth just like Atari had planned, thats what the XL/XE systems really needed, yes the MIO and Black Box are great, but they add to the clutter behind the keyboard and make for a bit of a messy solution, an expansion box that you could have placed your monitor ontop of and perhaps had a space or two for a disk drive/hard drive would have been nice. Maybe someone should consider that, perhaps even look into doing a small 80286 or 80386 standalone computer (or using an existing one) and placing it into the box with a boot rom to boot up APE or PROSystem, then you'd have a nice little box for using floppy, hard disk, parallel, serial and so forth. Its an idea...

Actually,

I'm the one who went through Mike Holmans stuff when he didn't pay his storage fee's. The equipment was moved to a computer junk dealer, I was contacted, flew out to CA. Went through almost 100 boxes which contained mostly musician magazines and rolls of OSS labels. A few boxes of ICD PR: connections, some game, a lot of Commodore stuff like a few PET's, some SX-64's, a TI 99/4a with expansion box, 2 Apple Lisa's, some Sony MSX stuff, more magazines, blank cartridge cases, some Atari service manuals and a Bell & Howell plexiglass Apple][e. Also a few crates of MIO casings, but no MIO's, no MARS-8's, nothing. I found a box of personal items like a Wells Fargo checkbook, some photo's and other personal items. After spending an entire day going through everything, if Mike Holman did do any work on the MARS-8, the MIO 2 or any other projects, they weren't evident in the contents taking from the storage space. Oh! Almost forgot, 4 huge pallettes of ICD books, all left out in the rain outside of the computer junk place, so they were all ruined. So if Mike was or is working on anything, the stuff from his storage space showed 0% signs any work being done.

4639. Yet another Atari 810 disk emulator...

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-01 00:00:00 UTC
From: Greg Menke <nospam@erols.com>
Message-ID: <af18l9xc.fsf@erols.com>
Source record: 57807

Hi,

After a while of on and off work, I finally have an 810/815 disk
emulator for Windows 95/NT. It provides a GUI, but does not
support P:, R: type stuff at this time, nor does it support
disk protection schemes or non-810/non-815 style disks.

Basically, its a convient way of getting your data off floppies,
and it doesn't require DOS.

It uses a normal SIO2PC cable (actually I built my own, but
the pinouts are the same so it should work OK).

The program is released via GNU and is free. The following
links point to various pieces. No homepage at this point,
(I'm lazy...)

www.erols.com/menkesjg/AtariServerSrc.zip - Source Only
www.erols.com/menkesjg/AtariServerApp.zip - Executable only
www.erols.com/menkesjg/AtariServer.doc - Docs in Word 6 format.

I'm interested in adding TCP/IP support to it, so with
a bit of work writing a handler for the Atari, it can
gain access to the internet. Of somewhat lesser interest
(to me) is adding support for copy protection schemes/
other devices. I would be very happy to work with others
in enhancing this program, however I feel strongly it
should remain under the GNU License.

Thanks,

Gregm

(replace nospam with menkesjg for email)

: >been a full 3d game, like the asteroid sequence in empire strikes back...

Unfortunately, a zillion more people have heard of Centepede, Frogger and
Battlezone than have heard of Star Raiders. I'd be surprised if Hasbro
bothered doing something like this. (Sounds like what you were hoping for.)

: Battle Sphere from 4Play for the Jaguar is due out real soon now
: (there have been problems getting the encryption key to make the
: cartridges). Star Raiders is given as the main source of inspiration
: for Battle Sphere. You might want to check out rec.games.video.atari
: or alt.atari-jaguar.discussion to find out when it is finally
: released.

I haven't looked at their site in a few days. When (IF!) that game comes
out is when I'm going to actually bother buying a Jaguar. I like my
PlayStation for the most part. :) But BattleSphere sounds like an excellent
excuse.

On the other hand, there's Colony Wars for the PSX and PC which has been
making me pee my pants when the commercial comes on. :) Anyone know
anything about this? How does IT stand up to the original Star Raiders?

I used a PAL multysystem TV to connect an NTSC Atari and it was working fine.

almost all of the new Tv's in Europe are Multysystem Ready,

Regards,
Nir Dary

Well done. Didn't try it but the interface looks good.

> I'm interested in adding TCP/IP support to it, so with

I am also interested in TCP/IP forwarding for Ape98. If anyone writes an
Atari client please let me know, I will be happy to contribute some source.

Seems like a zero-overhead connection oriented, and a broadcast/listen (UDP) mode
would be a good start. Say just return uncompressed packets to the Atari
as serial data w/ a fixed packet size and small source address header?

One more packet for a connections list would be useful too.

Accept the same uncompressed packets and you have a simple protocol that
any programmer could use within programs, or say via small N: driver.

> for instance APE is a DOS program which should not be run under Windows.

Could you elaborate on that a little? You might be suprised to find out that
there are fewer barriers in a Win32 DOS box between the comm hardware and
the application, than there are when running a Win32 app.

4644. 800XLDJ <-> SIO2PC/APE

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-01 00:00:00 UTC
From: "Marius Diepenhorst (pokey)" <pokey@dds.nl>
Message-ID: <01be1d12$ecb2a4e0$47e79fc2@default>
Source record: 57812

Joho!

A few days ago I found a very GREAT SUPERB program named 800XLDJ on the internet. On my MEGA STE and MAGIC os it runs great.

It's a program like ape/sio2pc running on ATARI ST, emulating your atari hardware.

There is one great problem:

the diskformat (*.di) seems to be incompatible with .ATR/.XFD images....

Does anyone know a converter or having a solution for this problem.

Thanx

MArius

4645. Atari-RGB Monitor connection

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-01 00:00:00 UTC
From: Emmanuel Fernandes <manu@ifdh2.sc.ucl.ac.be>
Message-ID: <3663C819.3B601E79@ifdh2.sc.ucl.ac.be>
Source record: 57813

Hi Everybovy!

I need some help. I have an Atari 130XE and a Phillips RGB monitor.
I know it is possible to conect the
Atari to the RGB Monitor, but the output jack on the Atari is a DIN 5
pins jack. In my monitor, I have
three possibilities : a TTL RGB Input, but it is a DIN 8 pins jack
(grrrr!!!), a typical (European) Scart jack, and two
jacks (RF like), one for video and one for audio.

Can anybody know what to do ?

Thanks for the information

Bye!

Emmanuel F.

Thanks! I know its pretty basic, nothing like as comprehensive as
APE, but it is fun to work with. I like the disk selection dialog
the best. I have 169 floppies copied to disk images and this
screen makes it LOTS easier to find a given program.

I was thinking along the lines of making the PC something of a proxy, using
N:, where the desired address and port is supplied via the filename. Granted
the SIO is block oriented, but the PC could "blockify/unblockify". I was
thinking only of TCP at the moment, although UDP is conceptually a bit easier
to envision. If TCP were implemented this way, FTP/Telnet/HTTP/email/ whatever
clients could be written for the Atari without a lot of change to the "normal"
sockets based architecture. This also allows several concurrent connections.

If the ICMP/DNS overhead were dealt with by the PC, the Atari is left to
transmitting the desired address/port to the PC, which opens the socket and
relays the socket level data to the Atari. This would be a little easier
than a primitive sockets API for the Atari itself.

I think I know how I'd like to approach it on the Atari side- I guess a $600
AUTORUN driver is a good start, at least Asm/Ed will make that easier. If
the smarts can be kept in the PC, the Atari driver can be small.

There are some finer details such as dealing with the connection oriented
issues, the PC will keep the sockets open of course, but the Atari has to
be able to close them so the PC can also. Since IOCBs are used via N:,
maybe the PC holds the socket open until the Atari closes the IOCB,
reboots, or re-opens the IOCB. As far as compression goes, do you have
any ideas on a low overhead algorithm for the Atari side?

All I need is time... Stupid jobs keep you from the fun stuff.

>
> > for instance APE is a DOS program which should not be run under Windows.
>
> Could you elaborate on that a little? You might be suprised to find out that
> there are fewer barriers in a Win32 DOS box between the comm hardware and
> the application, than there are when running a Win32 app.

I admit my comment is mostly taken from a somewhat cursory read of your webpages.
From personal experience timing sensitive DOS programs tend to suffer from
inaccurate timing under Windows- but thats a general observation. A given app might
or might not have problems on a given system, or with a given CPU speed for that
matter. I will certainly defer to your experience here, my comment was induced.

My approach was to use only the Win32 services, so there is no hardware access
at all. Consequently it runs fine under NT without resorting to
screwball drivers. The problem is, you get undefined latency and a truly obnoxious
and confusing API to deal with- and it makes it impossible (I think) to grab the
COMMAND level as the header is received because I don't read each character
individually.

Thanks!

Gregm

4648. Reparing my Atari XE game system

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-01 00:00:00 UTC
From: gengiskanhg@hotmail.com
Message-ID: <741crt$rb9$1@nnrp1.dejanews.com>
Source record: 57816

I have an ATARI XE game SYSTEM out of services for 5 years.
In the monitor (a TV) only can be see TRASH, There isn't complete
response to the keyboard. Somebody tell me, it was a CHIP, but I don't
have any tecnical manual, so I can't do anything.

In my old city there isn't any service for the ATARI.
Now I live in Mexico City, I wan't to know where can I go for repair my
ATARI or where can I get information about this problem.

Thank you for your help!!!

You can't get RGB out of a stock XL or XE but there's probably
no reason you couldn't run the video and audio outputs to the
monitor. All you need is a DIN-5 to phono jack converter.
Looking into the port, the Atari outputs are:

```
__ __
/ |__| \ Try and imagine this is a circular jack <grin>
| 3 1 | Pins are: 1. Composite Luminance
| 5 4 | 2. Ground
\__2__/ 3. Audio
4. Composite Video
5. Composite Chroma
```

Check Deja News for the newsgroups I mentioned previously. There was
a recent discussion among the developers of Battle Sphere and others
as to the merits of Colony Wars (I think), the Star Wars based gaems
(X-Wing, Tie Fighter), other console based space games, and Star
Raiders.

Hi to all,

I looked around on the internet and found a UNIX developed for C64.

http://hld.c64.org/poldi/lunix/lunix.html

Maybe somebody could translate the source to 8-bit, there was written that
most things where done in SMALL-C.
This OS is being able to ping (TCP/IP) so it's a start to do some internet
access on 8-bit...

Gtx,
Sysop*TXG

They prolly were 8-bits in Coin-Op clothing or specially made coin-ops
for that event. Since both of those games are made by Lucas Arts, they
prolly thought, "Hey, let's plug our new games and make a buck at the
same time!".

Hello,

Who's Mike Hohman? Also, why did you let him "borrow" vaporware like
that w/o getting some sort of "insurance" in case something like you
described happens? Maybe it's because us Atari people are trusting in
the fact that since we are all in it to keep the Atari dream alive, we
don't stop and think that SOME (very little but some) Atari folks would
stab us in the back.

I know I prolly answered my own question but I would like to hear your
answer anyway.

Nothing to do with Atari 8-bit computers, but at one time Atari did try to make IBM-compatible PCs. (They were XT-clones, which were already becoming obsolete.)

Actually, I've been wondering if any of the newer space sim type games on the psx were up to snuff like star raiders..

Is it so much to ask that a game be simple enough to control, have lots of glitzy effects, yet still be addicting to play??

Star Raiders, while somewhat simplistic, still had much depth.. all these new space flying things have WAY too many controls, aren't as intuative to fly, and are more complex in many ways then they need to be.. addiction is the key, and replayability, which most games sorely lack.. I've STILL never beaten things like rainbow walker or bounty bob, and though Tomb Raider looked MUCH better, I'll end up haveing played it much less in the long run...

whatever happened to random events in a game to make them replayable???

'Behind Jaggi Lines' was the beta version of 'Rescue on Fractalus'. There
was one bug in particular which caused all the 'good' astronauts to appear
in just 2 locations, so all you needed to do was go back and forth between
those points, grabbing astronauts. Once you were done, you knew any other
astronauts were aliens. In the same vein, 'Ballblaster' was the beta
version of 'Ballblazer'. Check out the easter egg when one player shuts
out the other 8-).
I also liked 'Koronis Rift' (I NEVER figured out what all the devices did)
and the 'Eidolon' (I got THISCLOSE to finishing the game!). Lucasfilm
Ltd. really did a great job, as did the early Electronic Arts.

If you're into Infocom games, don't forget 'Hitchhiker's Guide to the Galaxy', based on the Douglas Adams book. It's funny and very much in the spirit of the book. It really helps to read the book first. Hint: don't drink the Advanced Tea Substitute! ;-)

Did anybody ever get the game with the original packaging, complete with peril-sensitive sunglasses, pocket-fluff, and the insulting green ball?

Bob is correct in that it will only allow a NTSC machine to play Euro games
better. You still need a NTSC style of monitor to use with the PAL
upgrade.

> > I live in Belgium where our TV use the PAL system. I have an 800XL
> > from USA (with NTSC system). Is Nir device the correct device to solve
> > my problem and use my Atari with PAL TVs ?
> >

The only way you could accomplish this is to replace the oscillator, RF
modulator, ANTIC & GTIA chips, and probably a few other compoents
to make your 800XL a PAL machine. And I would suggest getting the
Atari 800XL service manual. The schematics that come with it point
out the difference between a PAL and NTSC machines.

Try and find a TV that does PAL and NTSC...this would be your easiest
solution. A lot of military base exchange's sell these type of TV's.

What makes it a special make? How is it non standard? Even so, could
not someone hook up a standard RF modulator to the composite out pin
signal?

I dunno on that one.. it's nice, and very detailed, but doesn't have the addiction factor.. plus the missions are somewhat difficult, and limited.. course I haven't bought the balance of power expansion pack.. yet...

maybe I'll see it for $10 or such one of these days...

It'd be REALLY nice to see 90's updates on these titles.. a fractalus one
especially would be SUPER!!

same with eidolon, and koronis as well... not tons more complicated controls
and such, but the same great gameplay, maybe a few added controls, and of
course today's graphics...imagine the alien in fracatlus done in full 3d
animated graphics.. (drool!)

Not sure of the current availability, but you may want to check out the Unofficial Infocom homepage done by a fan at: www.csd.uwo.ca/Infocom/

There are several cool links, where you can get solutions (one of them has the Invisiclues posted), learn about the different and amusing bugs, and so forth. You can also download the original Zork Trilogy (they're the only games that are now PD) plus "Zork: The Undiscovered Underground," a prequel to "The Grand Inquisitor." It's a very fun and nostaligic (albeit short) game. Anyone who's knowns Infocom's style will enjoy all the little touches here.

Oops, oh yeah. I was thinking this might be a great use for the Interrupt line on the SIO interface- it would require a modfied SIO2PC, but the PC could raise the interrupt line with CTS or something, then the Atari could catch the interrupt and query.

Kind of sucky because a standard SIO cable wouldn't work. Probably each packet from the PC would include a "more data" flag, prompting for another query- but ultimately it'd fall back to a timed poll.

I'm in something of 2 minds. I like the sockets API idea on the Atari, but that adds a fair bit of overhead, and what I think I'd want in Atari Basic is a simpler approach where I use an IOCB open to a given host address w/ port, if it succeeds, I have an operational TCP/IP connection. I then read/write using the normal routines and close when done. There are a few other operations which might use useful to implement via XIO. (Flush buffers, interrogate for more data, set blocking/nonblocking) This doesn't speak to accept/listen, which could be somewhat problematic. I think it'd be kind of cool to write ftp/http servers for the Atari 800 and this level of sockets connectivity would be sufficient for basic needs.

I think being able to open and close sockets in a simple way, leaving the hairy details on the PC is a good approach because of the limited resources in the Atari. It also fits a little better with the IOCB model also.

This doesn't approach the stack orientation you're speaking of, but it does
offer simplicity and somewhat easier coding.

If the PC handles the blocking/unblocking of data, than the Atari's problem
more resembles the way DOS moves data in and out of disk sector buffers-
a much simpler problem than a TCP/IP stack.

If we keep talking, I'll get excited enough to start writing it!!

I think you're right. My preference is to keep the Atari side as small as
possible. The savings of lightweight packet compression may not add much
when you take the performance implications into account.

>
> Serial comms in win32 apps are completely message based, which is why you get
> the terrible latency and halting behavior when vxd's block. Blame microsoft :)

It is pretty yucky. If the machine is idle, latencies are quite low- but if you
do ANYTHING on the desktop, performance becomes unpredictable- even in NT.

>
> Dos boxes go right through a chain of VXD's to the hardware. Still there

>
> I've never even used NT, so I couldnt speculate on how WDM device drivers
> do it.

I can't say NT does much better of a job. I ran AS under 95 and NT and saw
similar performance issues. It works under both, but not very well on either
if you're doing much stuff with the PC at the same time. You end up with
lots of retries from the Atari because the protocol timing specs are exceeded.

>
> Microsofts real crime is thier poorly documented brain twisting API. And saying
> 'poorly' is giving them undue credit :)
>

That damn thing has been a mess since before Windows 3- Win32 just made it
worse. M$ had a chance to do it right and keep backwards compatibility
by maintaining a "legacy" Win16 API, but I guess it was easier the way they did it.

You know, Star Raiders jaded me so much that when people were going nuts over Wing Commander, X-Wing, etc. I was like "Yea, they're nice, but....". In SR, you had to conserve energy, manage ship damage and repairs, decide when and where you needed to go, etc. It was more like piloting a ship, you were in total control. In WC and XW, you were sent out on a predetermined course with no decision on your part, and had to complete missions that were more like solving puzzles. For people who never experienced SR, these games were amazing. But for us Star Commander Class 1 vets, they were a little ho-hum, almost a step back. Good graphics though.

My pick for a game that matches the gameplay of Star Raiders is not a space game, but a jet sim. Fleet Defender from Microprose gives me a lot of the same feeling, control and excitement that I used to get back in '82 staying up all night play SR.

Another option is to ignore the RF output and use the monitor
output. If you don't have a monitor or TV that will take audio
and video input and you're desparate, you can run the Atari
video/audio into a VCR and from there go the TV cable route
to any TV.

Anyone have a copy of MULE they would be willing to part with? It must include (at least) the disk and the folder. C64 or Atari format preferred.

Please send your asking price to:

sjohnson@mitre.org

Thanks,
Steve

4682. SIO2PC, and an old PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-02 00:00:00 UTC
From: Trystan Negus <tnegus@matra.co.uk>
Message-ID: <743eqc$85j$1@guardian.matra.co.uk>
Source record: 57753

I'm considering using an old 8088 PC for hosting APE or SIO2PC, under DOS. The only problem I can see (other than the 8088 not being fast enough...would this be the case?) is getting the ATRs into the PC in the first place. Does anyone else have an antiquated old granny PC and the same set-up? If so, can DOS network? ...or are serial port comms enough?

Okay, I can do mass floppy exchanges or remove the HD and bung it in my main PC temporarily, but I'd rather have a method with less hassle!

Thanks in advance,

Trystan

In reply to Michael Current's posting, yes, I think Page 6 Publishing will still be taking on new subscriptions but anyone who wishes to subscribe, please note (as I mentioned a while ago) that publication will cease with Issue #92; anyone subscribing from Issue #86 onwards will get a full 6 issues (at ï¿½15.00), but from Issue #87 onwards you will only be charged for those issues remaining. It's probably best to contact Page 6 Publishing for exact details on subscription details, but Les did mention in his editorial that it is his intention that no-one will lose any money on their subscriptions.

Hi Trystan--

If you don't already have it.... A LAPLINK (parallel) cable is a great tool for this sort of thing. There are DOS (shareware/freeware?) versions of the software that will connect any PC computer with LPT1 to another. I am sure there are other ways, but this beats the heck out of "sneaker-net" :)

The cable is about $10 and available at most computer stores.

I have an atari "slave" pc and the setup works great with APE :)

have fun,
Steve

Hi
I use an old IBM PS/2 for my APE computer. I used laplink and a serial cable to transfer some ATR files in. Before I had laplink I used a terminal program. Telix I think and a null modem cable and transferred files that way. Now I just zip up some files when I want to move them because I already have most of it transferred.
I don't have any speed problems at all even using doublespace to increase my HD space.

I see the Journey to the Planets thread has come round again, maybe
this should be a FAQ? ;-)

Erm.. actually I don't think your game crashed, that sounds *very*
much like the end to me, assuming you did actualy land safely on the
empty landing pad, and didn't crash into to it. After you land on
your home planet, you get out of your ship, the music plays, and
everything else stops. Maybe you just started a new game, which took
you back to the shrine? Unfortunately the end is a bit of a let down
after all that hard work, but there is only so much you can cram into
one of those carts. Still felt great to finish it tho'

4687. Re: Yet another Atari 810 disk emulator...

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-02 00:00:00 UTC
From: idavis@my-dejanews.com
Message-ID: <743p4brhg1@nnrp1.dejanews.com>
Source record: 57758

Here's just a thought on the subject. Why not write the ape/disk emulator as basically a server, and with something like the r: handler, just write a browser on the atari, that will request a page, and display what is sent back. Let the pc do the tcp/ip and ppp work for you, just sit there and listen for a request from the atari, and when it gets one, then it goes and grabs the page, and ships it to the atari for display. Just write the pc side kind of like a proxy server, only a little smarter, keeping the "protocol" off the atari. Ftp could be done in a similar matter. Telnet would be pretty easy if you were just mirroring everything back and forth from the atari. You just need a way to open up channels of communication between the atari and the pc, and let the pc handle the tcp/ip side. If this is what you are already talking about then just slap me.

Isaac indavis@juno.com BTW: I have written some proxy server type programs (port redirection) for the pc, so I would be willing to lend a hand on that part.

4688. Using OmniMon XL

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-02 00:00:00 UTC
From: 8bitz <8bitz@my-dejanews.com>
Message-ID: <NEd92.17487$el4.28856737@c01read02.service.talkway.com>
Source record: 57759

Greetings
I have had my omnimon modded XL for 11 years and still really don't
know what it's capabilities are.
Can someone point me to a resource. I do have the mapping your atari
book.
Any info greatly appreciated.
Thanks
Mark

4689. Re: Using OmniMon XL

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-02 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <743sd7$1lh$1@alexander.INS.CWRU.Edu>
Source record: 57760

```
Omnimon Basics
Enter Omnimon:
SELECT/RESET
OPTION/SELECT/RESET (always use this
if entering from BASIC)
JSR $C001 or X=USR(49152)
Will enter Omnimon upon any encounter
with a BRK instruction.

Once in Omnimon:
PC NV-BDIZC AC X Y SP
Program counter, status registers,
Accumulator, X reg, Y reg, Stack
pointer.

Leave Omnimon, return to program:
Hold START, hit RETURN, use D to
set PC first.

Command Summary:
A: Alter Memory: A addr byte byte... -
Used to change 1 or more contiguous
bytes of memory.
B: Boot Disk B - Will boot off of the
selected drive.
C: CPU Registers: C - Used to
display and alter the registers.
D: Display Memory: D (start addr) (
End addr) - Used to view memory data.
To alter memory, position cursor and
type change.
E: Execute Memory: E (option/=steps)
- Will execute one or more
instructions at a time and display
intermediate results.
F: Fill Prgm Buffer: F addr - Teach
monitor a sequence of commands for
later execution with the 'O' command.
G: Get File: G (filespec) (addr) = A
full binary load function, single or
double density. Doubles as disk
directory command.
H: Hex Arithmetic: H= (= oper) (=
oper) ... - Hex conversion allowing
addition, subtraction, multiplication
```

```
and division.
J: Jump Subroutine: J (addr) - Go
execute subroutine.
L: Link Drive: L (drv=) - Select
drive = and linked or sequential
sector modes. All disk I/O will go to
the selected drive.
M: Move Memory: M addr0 addr1 addr2
= Move a block of memory from anywhere
in memory to anywhere else.
N: Relocate Memory: N addr0 addr1
addr2 (addr3) (addr4) = Adjust 6502
code that it will execute in another
location.
O: Operate Prgm Buffer: O addr =
Execute the commands stored earlier
with the 'F' Command.
P: Printer Control: P - Screen I/O
and be echoed to a printer.
R: Read Disk: R (sect=) (buff addr)
(=sects) = Read one or more sectors
from selected disk drive into a
specified buffer area. See W for eg.
S: Search Memory: S addr byte byte
... = Search memory for and print out
occurrences of a sequence of bytes.
T: Toggle Format : T = Toggle between
hex and character formats.
V: Verify Memory: V addr0 addr1
addr2 = Compare 2 blocks of memory and
print out the differences.
W: Write disk: W (sect=) (buff addr)
(=sects) - Write one or more sectors
to disk from a specified buffer
address. eg. W 1 A000 40 (writes 64
decimal sectors, dumping $A000 to
$BFFF to sectors 1 to 64)
X: Disassembler: X (addr0) (addr1) =
Translate machine code into assembly
language. Can be used to create a
source file.
Y: Assembler: Y addr instr -
Translate assbly lang. into machine
code one line at a time. Usefull for
patching programs.

When i first discovered pc emulators, one of the earliest things i did
was get an apple emulator (applepc) and download all 4 of the LucasArts
games... had them on the atari, needed to see how they looked on the
apple! i have to admit, for the low-tech apple (at least lower than the
atari 8bit) i was impressed, good frame rates, smooth anims, etc (well,
on the emulator anyway) i have an apple II+ now, but i don't have the
cables to set up for apple-pc xfers... Also, for Infocom, i also enjoyed
HGTTG, but my all time favorite was Planetfall. (bootleg copy, no docs)
played totally from scratch w/ no hints... man, the days i lost playing
THAT game! very engrossing... almost cried when the robot got attacked!
(i think i already posted about my 'screaming' during the alien attack in
Fractalus, and my buddy falling over the back of his broken recliner,
even tho he knew it was coming!) :)

This is getting a bit off topic here, but one other really 'intense'
moment that comes to mind is the F/A 18 Interceptor (i probably have the
name wrong) it had 7 missions (last one i never finished) but there's one
mission where you take off from your base (or carrier) and head out to
the ocean toward the enemy carrier (or sub) and he launches an icbm
toward San Francisco, and you have to turn tail, hit the afterburners and
catch the freaking thing and shoot it down, or you and millions go up in
a nuclear blaze! VERY intense, tho graphically simpler than todays flight
sim (oh, this is for the amiga btw)

4697. Gave away my Diskey disk! Can you help?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-02 00:00:00 UTC
From: Larry Senetza <lsenetza@direct.ca>
Message-ID: <U%h92.264$_c.1084005@newsgate.direct.ca>
Source record: 57768

Hi,

A long time ago, I gave away my Diskey disk. The recent Atari 800 emulators have peaked my interest in the old 8-bit Atari again. I have downloaded two different Diskey ATRs from the Internet, but alas, they have been hacked to remove the copy protection, or should I say, been hacked to allow its use with the emulators. So, does any have an original, non altered ATR or PRO image of this disk? I would even settled for the single file, AUTORUN.SYS, from the original Diskey disk. Thanks if you can help.

Larry

Greetings programs.
I noticed a 'rare' buckaroo banzai game up on eBay with no bids at $30
:)

I have also run across a list of new shrink wrapped atari 8 bit
software and cartridges for $6.95 including buckaroo banzai.

here is the URL
http://members.tripod.com/eightbits/atari84sale.html

Please use the email address on that page for questions. Tell Angelo
8bitz sent ya :)

The proxy approach is not bad, but I prefer socket level support because it doesnt restrict your implementation of protocols. If a socket style interface could be implemented via IOCB, then one could write a http browser, ftp client, news, email- without concerning oneself with the proxy support on the PC end. It turns into an issue of relaying socket data back and forth to the Atari. I think UDP support could be implemented similarly.

The Telnet model you mention is very similar to what I'm thinking, it works fine for http/nntp/smtp/pop, for ftp it is necessary to manipulate a couple connections- somewhat more complex.

Implicitly, we need to be able to accept/listen for incoming connections. Possibly a parameter to an IOCB open would suffice- you read the IOCB until you get an identifier which is used in a subsequent IOCB open that completes the incoming connection. The PC is actually doing the listening/ accepting, but the Atari initiates both.

No slaps required unless you use a C-64... ;)

It's still great 12 years after I bought it, even to people of the
'Playstation' generation. I loaded Atariwin and 'booted' Star Raiders
to show my two nephews. At first they thought it looked funny, but
after a few minutes they were fighting each other to play it. I run
my sound card through a pretty powerful sound system (my recording
studio rig), they fell out of the chair when a photon torpedo
crashed into the shields.

Hmmm..the version you speak of came by way of me and me using Chipmunk
or some such proggy to remove the protection. No one had ever put
anything other than diskey 2 on the net...

Wish I could help you, after I patched my original to upload it died (OK
I dropped a PSX on it and it made a big dent in the disk) :)

Why are you after an original atr of it ?

The patched version works 100% and at the end of the day its still going
to be a copy of the original..

Hi there Ronald

Yep I remember / Love this game..

Written by Bob Dinnerman (?) and it was a fantastic bit of early sneak
peeks by EA. The demo appeared as if it had been sneaked out the back
door from EA but it was really let out by them..

Never had I seen a game sooooooooo wanted after this demo...

What a nice game too, still play it on my Amiga emu. And the name is
correct...

I still (sadly) watch the demo it plays when you put it in demo mode
even tho I have seen it a thousand times. And don't forget to fly under
the bridge and between the two thin towers like in the demo mode :)

BTW I think he has done a series of similar games on the PC called
Jet-fighter 1-3 ????

Hi Paul,

>Hmmm..the version you speak of came by way of me and me using Chipmunk
>or some such proggy to remove the protection. No one had ever put
>anything other than diskey 2 on the net...

There are two different ATRs, one named DISKEY.ATR and the other
DISKEY_UTIL.ATR. They are both the same program by Sparky Starks.

>Why are you after an original atr of it ? The patched version works
>100% and at the end of the day its still going to be a copy of the
>original..

I thought someone might ask this. When I had the original, I made a
copy on which I removed the protection. What I did then, I don't
remember. So after all these years and have given away my disks, I have
come across these 2 Diskey ATRs. I have disassembled the altered
AUTORUN.SYS file on both images, and found both to have altered the code
differently. So...at the start of the day, I had nothing better to do,
and at the end of the day... I'm just plain curious! :-)

>I am pretty sure that one file won't do it.

Yes, AUTORUN.SYS will do it if someone will send it to me. The file you are thinking of, is simply named "D", which is a basic program called in by the AUTORUN.SYS file and does that fancy titling stuff at the start of the program. It could be DISKEYDAT, but that, I believe, is an image of the first 2 sectors of a DOS disk.

>other difference so I am wondering why you see that as a problem.

There is absolutely no problem. I suppose it is not bad that the copy
protection has been removed as it allows emulator users the use of
the program. However, I am simply VERY curious to see the original
coding. This is why I hope someone can provide me with an image of
an original (unaltered) Diskey disk, or, at least, the file AUTORUN.SYS
from this disk.

Although the humour <g> is one of the game's best attributes, I found it to be actually one of my least favorite Infocom games. Never mind that some of the puzzles were tricky (or illogical at times). My biggest gripe is that it amounted to nothing more than a "treasure hunt," in which you grabbed everything in sight to work your way towards a solution at the finale. I felt it lacked the sort of sophistication that made the other Infocom games what they were. "Hitchhiker's" had its moments, like experiencing the story from different points-of-view, but overall I didn't have as much fun in it than the others.

: Did anybody ever get the game with the original packaging, complete with
: peril-sensitive sunglasses, pocket-fluff, and the insulting green ball?

I miss the old fancy packaging myself. A few years ago, I bought the re-releases on CD-ROM for my PC, and well...Xerox copies of real items just doesn't cut it!

I was concerned with getting data back to the Atari using a scheme like this.

How would an application know data was ready? I believe if there were no
central handler, the application would have to poll with read or status
commands to see if data was in the rx buffer.

A secondary device driver could itself chain to any R: driver present, and
just provide a new API. This would have the advantage of working w/ any
serial device, so even a XM301 could interface to a client app running on
a remote shell server or whatever.

The SIO2PC software could then be just one of many possibele servers to the
generic network client.

Connections could be opened using IOCB commands, and callbacks to program
code could handle data that is received.

The R: driver would take care of serial buffering and flow control, while the
network driver could take care of reliable transmission/reciept and
the connection stack.

> If the ICMP/DNS overhead were dealt with by the PC, the Atari is left to
> transmitting the desired address/port to the PC, which opens the socket and
> relays the socket level data to the Atari. This would be a little easier
> than a primitive sockets API for the Atari itself.

Yes, the real horror of PPP for the Atari is the TCP/IP part :) The PPP
packets are easy.

> be able to close them so the PC can also. Since IOCBs are used via N:,
> maybe the PC holds the socket open until the Atari closes the IOCB,
> reboots, or re-opens the IOCB. As far as compression goes, do you have

> any ideas on a low overhead algorithm for the Atari side?

RLE would be a good choice, but since packets will probably be small and
not transferred in massive amounts, it may be best to just leave out server
side compression to keep the driver very small.

> COMMAND level as the header is received because I don't read each character
> individually.

Serial comms in win32 apps are completely message based, which is why you get
the terrible latency and halting behavior when vxd's block. Blame microsoft :)

Dos boxes go right through a chain of VXD's to the hardware. Still there
are some problems when other VXD's block, thus the timing issue again, but
just not as bad.

I've never even used NT, so I couldnt speculate on how WDM device drivers
do it.

Microsofts real crime is thier poorly documented brain twisting API. And saying
'poorly' is giving them undue credit :)

Yes i have been using it for the last eight years and about two years before it got a name, but then again i wrote it!

Strange its been out as freeware since September 1992, yet i have not seen any listing in any of the main Atari 8bit archives i have been so far?

At least i know two people that have used it, Michael Zino of Manhasset USA and Raphael Espino of Peterborough (Manchester) UK!

Then again most of this newsgroup probally does'nt know what Assembly Source Interface is!

Well ASI is the best disk-file based dis-assembly program on the Atari 8-bit, and you dont need to take my word for it!

Theres a copy of the latest freeware release on this newsgroup!

4719. Re: SIO2PC, and an old PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-03 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.981203001824.27298E-100000@vtn1>
Source record: 57691

I first used an Eagle PC-Plus (8088 with 256k and two floppies),
then an XT clone (Oh wow! 640k and a 20 mb HD!) and finally,
a 386 with a 1.2 mb HD (oh joy!) with SIO2PC. All worked well
and speed is not a problem--the 8088's plenty fast enough for
SIO2PC disk operations.

With the old Eagle, I used custom Atari disk formats (354k) to
maximize floppy usage on the DOS 360k disks and set up a Sparta
startup.bat to load from the a: and b: drives. The floppies were
a little slow but still beat the heck out of a standard 1050
since the SIO2PC data transfer rate with Sparta is about double
that of a stock 1050.

I wouldn't recommend APE for use with the 8088 box as I could
never get it to run on one and it uses more RAM than SIO2PC.
To get your best speed with SIO2PC, you'll want to maximize
free RAM on the PC so you can get maximum RAMdisk sizes in
the Atari images. I would recommend Drvspace (Dblspace in
DOS 6.0 or 6.2) or Stacker: odds are pretty good the old
beast's HD is not all that big and the compression software
does not noticeably slow things down.

As to transferring files from the PC to the "granny":
MS-DOS 6.22 comes with Interlnk and Intersvr which permit file
transfer between computers using either the serial or parallel
ports. Assuming your PC's last drive is C: once you install
Interlnk on the PC and Intersvr on the 8088, DOS will see
the "granny's" floppy as D: and its HD as E:

The DOS Help facility includes diagrams for the requisite
cables (essentially the serial one is just a null-modem).
With my system, I use a regular modem cable and a null-modem
adapter plug to connect the 386 and 8088 boxes. It's then
simply a matter of copying files. I believe this is the
simplest way to move files between the two computers. The
transfer rate via the serial connection is around 115k baud.

I would not think you'd get much success popping the HD from
the 8088 into your PC as the controllers are probably
incompatible. When I put the 1.2gb HD into my 386 I mounted
the old 100mb HD as the "slave" and transferred that way.
Because of the incompatibilities between the EIDE drive C:
and the old IDE D: it took the computer about 10 minutes
to get through its self test and boot. Odds are the "granny"
drive is not even IDE so you might not even be able to access
it.

>
>Be nice to have one with better graphics then the 800 version....

Actually, having played them all, I wound actually nominate the 5200 version over the 800 version. Yes, it's the same game, but the main thing that makes it better is what is usually the 5200's Achilles Heel: the controllers! 800 Star Raiders uses the usual digital stick. The 5200 controller is analog, and the game was re-coded to take advantage of this. You thus have more subtlety of control than on the 800 (it takes a bit of getting used to, but once you get the hang on it, you don't go back). Additionally, the keypad being built into the controller makes accessing it really easy. I used to have it so down that I could be maneuvering and firing while simultaneously hitting keypad buttons to adjust speed or whatnot. Tough to go on the 800, unless you have a controller with a fire button on the top of the stick.

Additional differences:
1. The sector scan clearly differentiates between ships and asteroids.
2. On the 800 version, no matter how your ship is destroyed, it cays it was "destroyed by Zylon fire". On the 5200, this was eliminated, so asteroids are no longer "Zylon fire".

Just my 2 cents. :)

Well, you'd need a cross assembler for starters as the PC doesn't use 6502
but I'm assuming you know this. What you're asking for is a lot of work
for someone and would probably cost you dearly in cash. Wouldnt it be
better to get abit more self-motivated and get off your but and look for
the info yourself? It's hardly difficult to come by. You can buy a book on
6502 or get it from your library. Atari documentation is freely available
across the net as is info on sprites. Whatever method you choose, don't
think it's going to be easy. assembler and machine architecture isn't
something you learn in a weekend.

>Chris Davis

Howdy Chris

WHen you want to connect a SCSI ZIP drive to a BlackBox you have two problems:

1) The ZIP expects PARITY enabled, and the BlackBox doesn't usually have that.

Solution 1: Hook the ZIP drive to a MAC/PC/whatever and switch PARITY off via software (modern HD's no longer have jumpers)

Solution 2: Buy yourself a PARITY PAL from CSS/Bob Puff. I probably comes with instructions (my BB+FB was at CSS for a checkup, so I asked Bob to install it for me), but I don't know. Otherwise you solder the parity pal to the 74LS640 chip. Either on top of the BB or below it (if you have a FloppyBoard, there is not enough room for the PAL over the LS640.)

2) The ZIP has a 25 pin "external" connector, the BB's SCSI connector has a 50 pin "internal" connector.

Solution 1: Try to find an adaptor cable (we only need two connectors and some wire, no electronic components) at a place like Jameco or RAdioShack. The things I've seen in their catalogs (I live in the Netherlands, Europe, so I can not "hop by" at the nearest Ratshack) that MIGHT do the trick have these silly pieces of metal connected to them, that are used to close up the back of a PC (every PC card has one of these "L" shaped things)

Solution 2: buy the connectors and some flatcable and do some soldering.

I have the Parity PAL and the selfmade adapter cable. Works fine.

I don't have the pinouts of both connectors by hand, but you might want to look for the IOMEGA ZIP FAQ. In the AMIGA section, it tells you how to build such a cable. Check out the numbering on you connectors before you start. In the FAQ, they mention that something is numbered wrong on a certain connector. That was not true with the connector I bought. And they suggest you start soldering all the cables that are not connected to ground. I did it the other way around. I soldered the ground wires together in groups (maybe you can use just one or two and connect the rest of them together on one connector) and did the rest later. It's easier to run one small wire around a bunch of wires already connected to two plugs, that the other way around. BTW I used a IDC

connector on the BB side. IDC are these connectors you press onto a flatcable.
Remember to keep them short. The FAQ mentiones 30 cm (1.2 inch) if I remember
correctly, I used 10 cm.

CU Mathy van Nisselroy

PS beware of you "terminator switch" settings.
The ZIP drive can only be SCSI number 5 or 6
Therefor you can not save you configuration on the ZIP drive.
Unless you change the code in the BB's EPROM ofcourse.

Here's the easy way to do it:

Go out and get a cheap-o game pad (digital controller) for your PC (I got one with a 100% rebate, so essentially it was free.) You will need to wire the four directional switches for the Atari stick across the same directional switches in the game pad. Then wire the fire button across the game pad fire button (you may need to internally modify your Atari stick to do this.) Then you'll have a PC compatible stick!

Depending on the design of the PC pad, you may even be able to use this method to wire up an adapter cable so you can plug any 2600 stick into it...

Not sure, but Jetfighter (1) had something similar; enemy fires harpoon(?)
missile at your San Francisco-based carrier and you have to shoot it down.

Doesn't really compare the the F/A 18 scenario you all spoke of (that I've
never seen). Flight sims have had a real bias against inclusion of
nukes; the only other exception I've seen is Back to Baghdad.

Sorry for getting off topic, but most of us are gamers, aren't we?

I guess no one has uploaded it yet... I've got a copy I could upload,
it's version 1.5 Plus, but I guess that's a bit outdated now. What's
the latest version? What new features does it have?

> At least i know two people that have used it, Michael Zino of Manhasset USA
> and Raphael Espino of Peterborough (Manchester) UK!
yup! That'd be me *grin*

> Source Interface is!
>
> Well ASI is the best disk-file based dis-assembly program on the Atari
> 8-bit, and you dont need to take my word for it!

It is a nice disassembler, with options for disassembling in AMAC and
Mac65 format, Hex or Decimal, AMAC-Decimal being my output of choice
(My brain never has worked properly in Hex mode, maybe I should ask for a
refund? :-). It also has an option for specifying which sections of
the file are code and which are data, so you can get decent
disassembly even when data and code have been mixed together in the
source. It is written in Turbo Basic, and can be compiled for speed.
If anyone is looking for a disassembler, then give this one a try.

> Theres a copy of the latest freeware release on this newsgroup!

It's best not to post binaries to this group, just use
alt.binaries.comp.atari8bit instead, and post a short message here
telling people what you've posted on the binary group.

Exactly, they called it Diskey 2 but it was merely a ripped and I think
cut down diskey (seemed cut down)

I 'hated' that game! Not only did the firing shots look stupid but you had a
large group of asteroids flying towards you when you don't use hyperspace
after killing the Zylons. Those earlier ST ports were not really that good.

Hmm...I hadn't heard of that one. But there are alot of those types of games for the PC starting with the Wing Commander series.

And for the Playstation there's Colony Wars which has the same SR feel in space flight combat. Still, as with all other games of this type, you can only do one mission at a time as oppose to flying anywhere you want in the galaxy like in Star Raiders.

But you forgot one important game...the official Star Raiders sequel on the 2600 called Solaris made by Doug Neubauer himself! :) It's more of an action arcade game but made real good use of galaxy map/hyperspace with using the second joystick button. And you don't even need that as it comes up after you kill all the ships in the sector. If you see a Solaris cart lying around, pick it up as that was what the 2600 version of Sr should have been like.

> I think if you polled any Star Raiders fan who has played all of these

I would rather have Activision, who done these types of games since the days
of the 2600, do a modern version of SR instead of Hasbro, who only care about
using nostalga to sell a bunch of shoddy looking and playing games.

In fact, I have some ideas on how to implement a new Star Raiders like
commanding more than one ship in your squadron, building up "experience" to a
higher rank, multi-player armada missions, standard missions like the 8-bit
game and a quest mode which is just like Solaris.

Get it! It really captures that Star Raiders feeling. Be aware that it can
be a hard game (Vengence even more harder) and it's mission based, although
you affect the story outcome depending on how well you do. Plus it's the
only game that makes using the Duel Shock control actually that useful :)

God, I loved this game on c-64.. didn't know that it was ported to Atari, but It shouldn't have been too difficult.. both have 6502-Instruction set... hm.. just thinking that it should have been prted to BBC Micros too... they also had a 6502.

By the way... how do you get that Damn Babelfish into your ears.. it always rushes out of the dispenser and disappears into a hole in the wall.
Never got any further than that.

Hi Raphael,

What do you mean by a refund!?

As far as i can remember, you got it free and i even paid for the disk and stamp to mail it to you by snail mail!

Also it's not ASI SV thats in this server while it lasts, but the older ASI v1.5AM Revised Edition, that one only supports hex mode, however it is a little updated in the docs department than the official DGS version!

Been thinking, maybe you could up-load it onto your website as it would be more safer than the other newsgroup you mention, also got my BMC music demo disk (full version with source) can suppy in both XFD and DC3 formats?

Yep, I did forget about Solaris. I remember seeing it at Toys-R-Us
years ago, but I didn't know it was Neubauers game until I read his
interview in ANALOG. I've been searching the flea markets looking for
it.

You can get a Star Raiders executable (EXE) at
http://aegis.mcs.kent.edu/~clisowsk/mirrors/8bit:yogis_site/BINARIES/EXEStoZ/

I use Atari800Win v2.4 and plays almost perfectly on it.

That's how Star Rangers plays. There are 17 'missions' but each one
is like a separate SR type game. You're dropped into a quadrant full
of starbases and friendly ships (on some missions). The Taureg
bandits start moving in from all directions and you and your wingman
warp around clearing out the quadrant while protecting your bases.
The missions are random so every time you play it's a different setup.
Of all the PC space sims this is the closest to SR in design. The
problem was in a PC Market dominated by the Wing Commander and XWing
series, Star Rangers just didn't have enough 'fluff' to make it.

Bob, Please.

You will gain no sympathy for Mike's problems if we never hear what they are/were. If you expect those who feel they've been shortchanged, or those of us who have heard nothing but bad news about FT for the last year or so to 'back off & give him a break', I suggest you have Mike send you a message explaining the problem(s), peel off the headers, and let him speak for himself.

I frankly appriciate anyone who tries to help keep the platform alive, but at this point even if/when he gets back on his feet and makes good on prior committments *I'm* gonna be *extremely* hesitant to step into the bear-trap that FineTooned apparently has become.

Most of us are adults here (you at least have to be old enough to be interseted this 'aged' system) and would appreciate real information about the status of FT, instead of the 'pat on the head'/handwave that, for whatever reason (good ones, I'm sure) you are giving us.

If he reads this, even if he doesn't quite know *now* how he can pay it off/make it happen/make parole/escape/sell the rights, at least he can attempt to explain *how* and *why* it went down the tubes and what he hopes to do in the future.

Hell, maybe if I read a straight answer I'll *help*....

If I had it at the time, I would like to have. If you have proof otherwise that I wouldn't have, please present it here. Otherwise, I would appreciate you didn't bitch-slap me whenever I try to put forth a possible solution to this little holy-war. Which, of course, I plan to never address here again, since so far everyone who does gets a kick in the privates *by you* when they do.

> and the rage that went with it.

I'll be the very first to stand up and admit that I have no earthly idea what the hell you are talking about. I don't remember ICD being such a reviled company. Did I miss something?

> As I stated before his problems are private. He will emerge when he feel comfortable.
Your
> wife/girfriend tickes you off, no one's business but yours

So am I to assume, since you and he are completely unable to answer the &*^$%&*^% question, that he had some sort of personal and/or financial trouble, and would like someday, after it's all settled to get back into the business?

I really don't know, so when you reply to this and kick me in the privates for even deigning to guess remember that many of us out here would empathize with such vague explanation as *that*, and wish him well?

> ..Offer him a buy out comparable to what he put our here and I am sure you will
> receive a response?

Well, I'd love to - but I have no idea what he paid, what is included, or any details of the "deal". I never tried to find out about the "deal", I was just happy to hear someone was picking it up and running with it. I was also looking forward to buying some of those products, now that I am older and more solvent than I was when I was selling 400's all those years ago..

>No one had ever put
>anything other than diskey 2 on the net...

What is Diskey 2? I am aware of the original
version that would not run on XL's, and the
tweaked version that would run on XL's.
There was even a complied version that
retained most of the Diskey features, but
I presume that was a "hack", also.

There are several files that are needed to make Diskey work, including a short
data file.
I am pretty sure that one file won't do it.

Its all well and good that he would be willing to sell the rights to company. However what he paid "THEN" which included actual hardware, pallettes of manuals, and then the rights are mostly gone. Its sorta like, the Tremails paid $100 million (roughly) for Atari back in 1984, all that was left of Atari in 1998 were some rights, licenses and some items left over at the JTS warehouse for $5 million.

So FT may have paid $40,000 for the right to ICD back then (it was something like that, Tom Harker from ICD told me at one point, but I don't remember the figure exactly). So here we are today with a envelope of rights and maybe some leftover hardware, so perhaps its worth $2,000-$4,000 in todays market.

Also take into account that back in 89 or 90 product demand was in the 1,000's for products like the MIO and MARS-8, but today you'll most likely sell maybe 100 each of your product, not much more, that has to be taken into account too when guaging the value of the assests.

Hi there,

Yes you did, many thanks. I actually meant a refund for the brain
that doesn't work in hex rather than for ASI which I'm plenty happy
with! That's why I put a smiley at the end of the sentence, meaning
it was a joke.

> Also it's not ASI SV thats in this server while it lasts, but the older ASI

He made a reference to his brain never being able to do hex very well.
The refund he was joking about was for his brain. That's also why he
had the smiley face immediately afterwards.

From: walker@netconx.net
Message-ID: <366870a0.164804832@news.netconx.net>
Source record: 57596

Are there any well written instructions on building an SIO2PC cable?
The few web pages I've seen on the subject all have cryptic
instructions and a poorly drawn schematic...

I'll be the first to admit that I'm far from being an electronics
expert and the schematics give me a problem to begin with...but if
there were some decent step-by-step instructions, I think I would be
able to do it.

I mean, I'm not a chef either, but I can follow a well-written recipe.
grin

Thank you for any help!

I have not commented on this, however I do have a friend who had an
order that was not completely fullfilled by FTs. I hate to say it but
at this point you make it sound like Mike is waiting to unload and not
really doing anything developmentwise.

Which is what most suspect anyway... so if Mike is not gonna surface
and give a reason I'm getting real tired of hearing about $$ amounts.
Yes it takes balls to buy into what he did, but at this rate it will
take even bigger balls to right the wrongs too. The longer he hides
the harder it's gonna be.

ANALOG Magazine published a BASIC program called DETOKEN that would convert M65 saved files to readable source code. I sometimes use a slightly hacked copy to "de-cartridge" it and remove the syntax that doesn't work with the disk-based version. You can find it on several ftp sites as DETOKEN.BAS or DETOK.BAS. If you have no luck, let me know and I'll hunt up a real disk drive and get a copy for you.

I'd have to check my Yogi local 'mirror' but i think it's on a mega disk,
and w/ an sio2pc cable the disk image w/ the cart image (which conjures
an image i am not at liberty to mention :) should work identical to the
cart...

I don't know if it's alcohol or drugs that makes you carry on
incoherently, but maybe you should only take half as much next time.

...and learn to quote the previous message so WE know what you're
referring to, even if you don't.

Sorry. To be honest I don't know which machine came first. I meant to say "released" on atari... sounds better :)

>

Yep. Do that. I took it from a comp.sys.cbm thread where some guy said that as a response to some guy. The thread was about the question if a C64 User was closer to programming his computer than a PC owner. The main argument PRO was that a C-64 had a basic Prompt (like atari and CPC) so most users started at least a few tries to code Basic programs. The main reason against this claim was that a c-64 player was typing load"bla",8,1 while a Pc owner points his mouse on an Icon.

-Brix-

(here it is again, like everytime :))
--
Listening to your car radio doesn't make you an amatuer radio operator.
Driving said car doesn't make you an automotive engineer. Hell, even
speaking doesn't make you a linguist. Yet, somehow, playing "Doom" seems to make one
a bona fide computer hobbyist, qualified to scorn me and my lowly C64.

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of my more prominent sources:
- Atari Classics, published by Bob Woolley
- New Atari User, published by Page 6 Publishing (Les and Sandy Ellingham)

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

4780. Re: spelunker II arcade rom..

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-05 00:00:00 UTC
From: lwhite6497@aol.com
Message-ID: <19981204225000.16704.00002876@ng141.aol.com>
Source record: 57598

>the arcade Spelunker or Spelunker II ROM?

What is a "Spelelunker II ROM"?
I.e. was Spelunker made into a cart?
Larry

4781. Re: SIO2PC, and an old PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-05 00:00:00 UTC
From: lwhite6497@aol.com
Message-ID: <19981204225800.16704.00002880@ng141.aol.com>
Source record: 57599

>>I'm considering using an old 8088 PC for hosting APE or SIO2PC, under DOS.

I was thinking about those very small PC's
that were the size of a disk drive. There
were several kinds. One of the last that I
remember (386, I think) was "The Brick"
or some such. If someone could find one
of those, it could be dedicated, with a built
in hard drive. Sort of the "ultimate Atari
peripheral." Anybody remember the name
of those small PC's?
Larry

4782. AMAC (was Re: Assembly Source Interface)

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-05 00:00:00 UTC
From: abaddon88@aol.com
Message-ID: <19981205000520.28268.00000141@ng-fd1.aol.com>
Source record: 57600

If you have trouble getting a copy I have a version I cracked(thanks to the instructions of someone that posted them here, sorry I forgot who!). I'll have to pull out the sio2pc and download APE though.
Just let me know

4783. Atari800Win 2.5 followup

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-05 00:00:00 UTC
From: rich@cstone.net
Message-ID: <3669e871.78891329@news.cstone.net>
Source record: 57601

A side note: I no longer have time to read news groups on any kind of regular basis. Even my scans via deja news are very intermittent these days, as my real world job is picking up extensively and will consume most of my time.

This means if you have questions or comments, you need to e-mail them to me if I'm going to notice them. And, if you don't mention Atari in the message header, you run the risk of being discarded by my draconian spam filters. So keep that in mind.

-Rich

4784. Re: Fine Tooned software

4785. Re: "The Star Raiders Academy" ANTIC ar

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-05 00:00:00 UTC
From: Anthony Baker <antbaker@arn.net>
Message-ID: <3668EE80.2F44C014@arn.net>
Source record: 57603

Hello,

Does anyone remember that game XTAL (The game from the ANTIC monthly disk)? That to me seemed damn close to something in the Star Raiders family. That game was MUCH longer than Star Raiders. It had pretty cool music in the intro. though.

Laters,

antbaker@arn.net

4786. Re: M.U.L.E. website

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-05 00:00:00 UTC
From: Anthony Baker <antbaker@arn.net>
Message-ID: <3668EF4B.675C051@arn.net>

$25.

COMMODORE 64/128

KNIGHTS OF DIAMONDS THE 2ND SCENERIO. floppy, player's guide, graph pad.
VG++/NM
$20

==========

WIZARDRY MODOR CHARGE PACKET. Includes charge card # 018357, and the folder it was shipped in (bulk rate). Also in folder is a MODOR CHARGE HOTLIST, a red booklet with dark blue ink, full of numbers. This seems to be all about a club for Wizards which promisses, "free poster, 10% off accessories, meeting Wizardry authors at events, 10% off promotions, etc.
NM
$20.00

==========

Here is the way I grade software. There are seperate grades for the box first, and what's in the box second. For example, VG++/NM would mean the box is VG++ and the contents of the box is near mint.

Shrinkwrapped (ss)
Self-explanatory.

Near Mint (NM)
This is the highest grade for an unsealed item. "Mint" is not used as a grade because, without a microscope and 40 minutes of inspection, perfection cannot be verified to everyone's satisfaction. Near Mint ranges from appearing unused, to an item that may have been used, but is without a notable cosmetic defect as evidence of that use.

Basically, a NM/NM package should be a reasonable simile to a fresh, unused copy.

Very Good Plus Plus (VG++)
This grade refers to an attractive, fresh-in-appearance item that, upon closer inspection, has been disqualified from the NM category due to (usually) one flaw that could not be overlooked.

For boxes, this includes: a small split of the seam; some clear tape on one corner.
Basically, and this includes the contents of the box as well, a VG++ item is qualified by having a noticeable, yet functionally insignificant defect that verifies that the item has been used. A VG++ item appears neither blatantly second-hand, nor does it have the sparkle of "brand-new".

Very Good Plus (VG+)
This is the broadest grade serving as a catch-all for any decent, presentable, average, usable (not marred or defective) item. People ordering VG+ items usually are prepared to accept an imperfect item representing the artifact that it is, and are going to enjoy it without being excessively preoccupied with cosmetic details. VG+ is a fine copy that is indisputably "used", being your basic "decent used package" for utilitarian purposes.

Boxes and contents will have some combination of one
to a few of the following
defects:
partial seam split (with or without clear tape
repairs), minor dirt ring,
some minor warping due to moisture, a creased
corner, small squishing of the
box.
The box and contents must be free of major
defacements, and will certainly not have ALL of the
preceding minor ones on the same piece!

Very Good (VG)
This is the beginning of "rough" for collector's
purposes. A VG record is
usually one that a collector will buy to fill a
"hole" in his/her library until a better copy
comes along. We usually don't advertise items with either VG
covers or discs unless they are deemed scarce enough
to attract a collector
for this purpose.

Good Plus (G+)
Averaged between VG and G,

Good (G)
Items graded "good" are very used and only
presentable to the least
discriminating collector. This classification is
usually employed for
boxes when it's the contents that's worth collecting,
and vice-versa; or when
the component in question is so very rare that its
existence in any condition
is regarded as manna from heaven. It should not be
confused as referring to "Good" COLLECTIBLE

Fair (Fr) or Poor (P) or Missing Component (*)
For advertising purposes, if either box or contents
is either Fair or Poor, we
treat it as functionally missing , and we have graded
only the component
that is G or better, essentially selling that
component "as is", theoretically
without its decrepit companion. In these cases, the
grade should include an
asterisk in place of the Fair/Poor cover or jacket to
reflect its effective
absence.

Supplementary Notations
Condition augmentations: there are some common
exceptions to the overall

condition of an item that merit independent notation
from the
overall grade assigned, rather than being "averaged
in" as with standard
gradeable wear. These are usually after-production
aberrations courtesy of
the record company such as:

Writing on front cover, back cover, label, tape
on seams or spine,
water damage (especially if it's growing "hair"),
applied era "pop-culture"
stickers (such as "right-on" with fist) etc.
These minute details are usually only noted on
rare and expensive items.

Probably because the device is that easy to build, it looks like it
should be tougher?

It really is as simple as it looks, a lot of people do not even bother
buying a circuit board: Just solder Black wire from Atari to 1489 pin
etcetera, kind of thing. Only actual part that you have to add is the
diode & that can be left out if you never plug anything other then the
sio2pc cable.

Little Board? I never found one of those, but did find a couple of old SBCs with built in most everything. Even bought a couple of 20 meg hard cards so I could set them up.

They work really well for auto booting a large ATR, but I always had trouble trading off the joy of only needing the Atari monitor for the difficulty in manipulating the ATR images.

AFAIK, everything you need for manipulating files is built in, but I never bothered to write a front end/user interface from the Atari.

Does your monitor have Video and Audio input jacks (RCA jacks) ? If so, I
can solve the problem for you. It is just a simple cable. I can help you to
build one if you need.

Bye,

Emmanuel F.

Yes, Dani Bunton and I corresponded quite a bit in the last months of
his/her life. BTW--I think Mike's MULE page sums it up best when it calls
MULE the best "strategy" game of all time, although role playing and finance
are also ways MULE could be classified.

I also have the Atari and Commodore emulators and MULE disk images available
for download on my webpage. http://www.geocities.com/Heartland/Acres/3234,
along with MULE icons and wallpaper. The wallpaper must be tiled to fill
the whole screen, and when tiled in this manner, the store is in the center
of the map. Then, the desktop icons can be placed to simulate installed
MULEs.

Hello everyone!

I have the following atari Compute's books for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Compute's first book of atari games"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each
plus shipping. I would suggest the 3 day shipping as it is only $3.00
and gets the books to you quickly at a reasonable price. Please e-mail
me if you are interested in any of these. Thanks!!

Douglas Carroll

4803. Atari800Win 2.5 released

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-06 00:00:00 UTC
From: rich@cstone.net
Message-ID: <pgpmoose.199812060013.1266@bureau42.ml.org>
Source record: 57621
Cross-posted to: comp.sys.atari.8bit,comp.emulators.announce

(This appeared to not go out the first time).

http://www.cris.com/~Twist/atari800win

Here is what's new in this version:

12-05-98 Ver 2.5 (a "beta" release)
* Consider this a beta release. It has not been tested extensively.
I will be releasing again soon to sync up with the general
Atari800 code base and address some other issues of my own.
* Any "sticky key" problems should be fixed on slow machines
* Warmstart reappears on F5 as if by magic :-)
* Arrgh! ATR images formatted while loaded into the emulator were
getting corrupted headers (they were reformatted as XFD). Modified
SIO code so that any valid ATR image (even megadisks) can be
reformatted by Atari800win.
* Added option to load Atari executable files individually instead
of requiring a disk image. This will NOT work for files that
require Atari DOS. I more or less lifted Ken Sider's routines
right out of MakeATR (actually I initially wrote a multi-segment
loader myself, but it sucked, so people can thank Ken for this
feature). When you do this the EXE will replace the disk mounted
in drive 1.
* John Frias contributed some icons (mine are retired to no artistic
talent land now).
* Fixed a problem with the R-TIME cartridge returning the incorrect
month. BTW This should come as a surprise to no one, but the
R-TIME is not year 2000 compliant.
* Fixed a small timing problem on keyboard input.
* Blank scan line option added for some video modes. Read the
readme.txt for why I still think this is a *really* stupid idea.
* Built a new ZLIB DLL which appears much less touchy about
alignment. I highly recommend you use the one included with
Atari800win as your DLL in general (slightly larger but works much
better).
* Drive status can be set directly from the disk drive dialog. This
is mainly so images can be switched to read-only on the fly for
some demos. You cannot use the dialog to override actual file
permissions - if the file is read-only to the OS, then it will
always be read-only to Atari800win (and that's by design, not
omission).
* Corrected small joystick bug that prevented the keypad from
working as joystick on port 1 while a real joystick was used on
port 2.

* Inserted a completely bogus wait after DDraw SetDisplayMode that
corrects garbage sometimes left on the screen. This very much
looks like a DDraw bug. The delay may not be long enough for all
systems. Email me if you still see window garbage on your display.
* 640x480 is now a "no visible menu" mode. Use F10 to get a menu (or
the keyboard accelerators - e.g. Alt-A + L is Atari/Load Exe). Let
me know if you find this a problem - I could make it configurable.
800x600 and up still have menus.

4804. Atari 8bit Gumball (Broderbund) - anyone have instructions for this game?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-06 00:00:00 UTC

A few years ago someone typed the whole thing into disk files. I downloaded it from one of the BBS on the IMR. Unfortunately the BBS I uploaded it to is now defunct and I didn't save the files myself as I have a hard copy. You might try one of the BBS still on the IMR--start with The Last Hope BBS in Vancouver; you can reach it via the Atari 8-bit web ring either by name or by looking for the sysop (Ryan Goolevitch).

Some months back there was
a thread about XF551 with the
720K Bob Woolley upgrade.
There was an added few bytes
of code to patch that wasn't in
the original article(s). It had to
do with proper density selection,
I think. I copied this message,
but can't find it. Anyone have it
handy?
Thanks,
Larry

My pleasure!

Steve's post about using a sio2pc cable with the Rverter driver for
RS232 has me thinking I should spend some time on that.

Existing design has an unused gate, so it may be possible to add some
functionality to it. Maybe just something simple like CTS<???> to
isolate modems from the chain when the Atari has to talk to another
device. I will try to keep it simple.

I remember it but never played it. The ad stated "Star Raiders was a
great game... for it's time". It used to be sold in the ANTIC Catalog
for about $15.95, written by a guy named Dave Reese. The plot had to
do with destroying an Ion storm threatening your planet. The ad
listed all kinds of things like warp drives, transporters, 3D display
etc.

I don't know why but I never ordered it. I've been looking for it on
the FTP sites but haven't found it yet.

I collect Electronic Arts flat-box (album style) games. Would you please look at my web site:

http://people.ne.mediaone.net/hughfalk/copy(2)21.htm

and write me if you know of any EA flats (games only) that I don't already have.

Dragon's Lair (EA flat version) is the only one I know about. If anybody will sell or trade me for it, please write me at hughfalk@mediaone.net.

Feel free to look around the rest of the site. Feedback is appreciated.

Thanks in advance,
Hugh

4818. Definitive Known Software Lists (cartridge and CD) [12/06/98]

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-06 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <3675321b.3817293@news.nls.net>
Source record: 57636

[NOTE: The Super Nintendo (SNES) list has been added -- 11/23/98.]

The Video Game Advantage Definitive Known Software List Collection

If you are looking for the most complete, detailed software lists
available you have found them. And the best part is that they are all
in a standardized format, so you can change system files without
having to learn a new style or format! Currently 32 of the 40 planned
files are on-line (2600, Intellivision, NES, Odyssey2, Sega CD, SMS,
SNES, and TG-16 all still need some work, and will be on-line as
soon as possible).

32 bit and 64 bit video game systems:

3DO REAL Interactive Multiplayer
Atari Jaguar / Jaguar CD
Commodore Amiga CD32
Nintendo 64
Nintendo Virtual Boy
Sega 32X
Sega Saturn
Sony Playstation
Tiger Game.Com

16 bit video game systems:

Philips CD-i
Sega CD
Sega Genesis
SNK Neo Geo / Neo Geo CD
Super Nintendo

8 bit video game systems:

Atari Lynx
Nintendo Entertainment System (NES)
Nintendo Game Boy
Sega Game Gear
Sega Master System (SMS)
TurboGraphx-16, CD, & Duo

Classic video game systems:

Atari 2600
Atari 5200
Atari 7800
Bally Astrocade

Colecovision
Emerson Arcadia 2001
Fairchild Channel F
GCE Vectrex
Magnavox Odyssey2
Mattel Intellivision
Milton Bradley Microvision
RCA Studio II

Classic computers:

Atari 8-bit computers
Coleco Adam computer -- see Colecovision
Commodore 64 / 128 computers
Commodore Vic-20 computer
IBM PC Jr. computer
Mattel Aquarius computer
Radio Shack Color Computer
Texas Instruments TI 99/4A Computer
Tomy Tutor 16-Bit Graphic Computer

*****

If this is of interest to you, the URL is:
http://www.io.com/~vga2000/

and the link is in the "Collectors Corner" section.

And if the game isn't on one of my FS/T lists, it
isn't FS/T :)

Michael

P.S. My old e-mail accounts all still work, but I'd prefer it if
people would begin to use the *new* account. Thank you!

4822. Atari in PC case?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-07 00:00:00 UTC
From: Jindrich Kubec <kubecj.spam@asw.cz>
Message-ID: <366BBBD8.B901BA4@asw.cz>
Source record: 57640

Hello!

Anybody has Atari built in the PC case?

I think that PC's power supply could be used without modifications.
AFAIK XF551 is standard 5"25 drive - it could be inserted normally.
Video output is no problem. The only problem I see is with keyboard. Is
it possible to attach PC's keyboard to Atari?

Look at:
http://members.aol.com/MacFalkner/aki
there is a building plan for an ATARI-PC-Keyboard-Interface.
(The new PIC-program version works great...:-)))

For your pc-case project i think the cartridge / expansion port will be a
problem.
I had my atari in a pc case for two years. Now i have build it back.

good luck, bye,
MacFalkner

4826. 6502 Cross-assembler

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-07 00:00:00 UTC
From: Trystan Negus <tnegus@matra.co.uk>
Message-ID: <74glbctki1@guardian.matra.co.uk>
Source record: 57644

A question (or 4) for the assembly programmers:

I'm about to start learning assembly, but want to get everything set-up first! If you use a PC for Atari 6502 assembly programming, what do you use? I've heard of TASM, but I understand it's a commercially available program. Are there any freeware equivalents out there somewhere? ...and do they run under Windows or MS-DOS? Finally, are there definitely advantages to programming in this way over the standard Atari assembler cartridge?

Thanks for any help,

Trystan

Nope. Unix needs all kind of funky memory management stuff that the 6502
simply doesn't have. I couldn't get on to the URL quoted but I suspect
someone has implementd some Unix commands but not actually got Unix
running them.

Howdy folks

I'm looking for the autor of the SHEOL demo.

First I downloaded the demo from his site. It turned out to be an ATR file. Most Eastern European demo's are DOUBLE density. So there is NO way to turn them back into DCM files (unless somebody tells me how many characters to skip at the beginning of the file. I'll use VTEX to copy everything to a new file then except these characters. Does a DCM file have a specific header I can look for?

Now I download a version of SHEOL from a Dutch BBS. It tells me it needs 256kB RAM. Man I HAVE 1MB. Every piece of software I tried it with sees atleast have of that. Why not sheol???

Does anybody know how to play the game Lifeforce by roklan?
I usually just sit and stare at the birth spiral and mess with the
joystick to get the cool sounds :)
Speaking of strange games. Alien Garden. Anybody know how many times
the crysyal flowers can mutate? Does it ever get exciting?
I remember the guy that wrote alien garden also wrote some commodore
game that was trippy. Moon something. Anybody know what that was?
Anybody have any good recommendations for other strange games?
Thanks

>I'm about to start learning assembly, but want to get everything set-up
>first! If you use a PC for Atari 6502 assembly programming, what do you use?

To assemble programs on a PC for the Atari, I'd probably use Fine Tooned's
publicly released version of MAC65 running on Atari800Win. I know that Xformer
3.6, the latest DOS version of Xformer, is much faster, but Atari800Win is by
far the best emulation of an Atari 8 bit for games. If you want to use sound in
your program, stick with Atari800Win. If you're not using sound, you won't find
anything faster than Xformer.
Since 6502 programming fits well in 38 or 40 columns, I'd edit, compile, and
debug on a PC by using an emulator.
(Also, I just noticed that someone has put up AMAC, the Atari Macroassembler as
an atr file. That would work on an emulator too!)

No. On the Apple][version, you can do something (hit both joystick buttons
at once, I think) to make a crosshair appear. I assume the crosshair is for
destroying bombs, although I've never managed to do it.

Unfortunately, the Atari joystick only has one button, so the method for using
the crosshair is different (and I haven't found out what it is yet).

4837. Web browser for XL/XE 8bit

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-07 00:00:00 UTC
From: "Timothy B. Kline" <morloc@acd.net>
Message-ID: <TmTa2.1878$Fw.11528@newsfeed.slurp.net>
Source record: 57655

Is there a web browser for the Atari 8bit (graphical or non-graphical?)? I was told that there is not one that supports SLIP or PPP connection, but on an enhanced (256K or higher) Atari, it seems one could support a low-end browser?

If anyone knows of one, could you either reply with info or EMail me at morloc@acd.net

I'm VERY curious!

>>> >it possible to attach PC's keyboard to Atari?

Just a note on PC power supplies: Many of them them require a certain
minimum load on both the 5v and 12v in order to operate correctly if
at all. In many cases it is neccessary to hook up a resistance
network if the load provided by the Atari equipment is not high
enough. This can even happen with some supplies if you just have a
motherboard but no drives and such.

Hi everybody!

I have received some demands for giving my schematics for the my
Atari-to-PC joystick interface. I made a very simple page in HTML format
with some explanations and with the schematics. You can find it at the
following address :

http://gauss.math.ucl.ac.be/~manu/Atari/joystick.html

Please, if you have any question, e-mail me. If someone build it and use it,
I will be very pleased to know.

Bye!

Emmanuel F.

4843. Shifted screen on new Atari800win..

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-07 00:00:00 UTC
From: mclane@dellos.demon.co.uk
Message-ID: <366d43e9.11554161@news.demon.co.uk>
Source record: 57661

Just incase, myself and another person both get a slightly shifted
screen on the new (2.5) Atari800win when you change machine op sys's
under Hardware.

ie it boots up in 800x600 perfectly central but when you change from say
800b to 130XE the screen shifts to the right about 1/2 and inch (maybe
more) and cuts off that portion from being displayed.

Any others getting this...

(btw, to re-centre the display either swap between display modes or
untick GDI and apply then retick GDI and apply it)

Cross-posted to: rec.video.desktop,comp.sys.atari.8bit,rec.audio.misc

The device in question was the Atari Color Organ. I do not know of a similar standalone device, but Play Inc's accessory package for Windows, Gizmos '98, comes with a color organ program that responds to the audio coming into the PC and displays the result on the PC screen. It has a number of different variables on the control panel that allow you to vary the color image. Pretty cool. Gizmos 98 retails for $50.00 at Best Buy.

4851. pokey sound

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-08 00:00:00 UTC
From: TJ Edmister <Damage_X@hotmail.com>
Message-ID: <366DB975.EA13AB19@hotmail.com>
Source record: 57543

I am trying to make a simple music player in assembly and I can't get the third or fourth sound channels to work. No sound comes out, even though the first and second sound channels work fine.

$D200 pitch 1
$D201 volume 1
$D202 pitch 2
$D203 volume 2
$D204 pitch 3
$D205 volume 3
$D206 pitch 4
$D207 volume 4

that is how it goes right? (I know its volume and distortion and volume-only not just volume)

what is the problem then? I am as sure as I can be that it is not an error in my program. I tried setting $D208 to 0, that had no effect.

thanks in advance

Emmanuel, Awesome looking schematic, unfortunately it would take me a year to build, if I ever got it right. Are you (or anyone) making one to sell? I would be very interested in buying one. Please. Nothing special, maybe about a 4' cable to the pc, and a box on the end to plug the atari joysticks into. You could probably go commercial with something like this.

Not ashamed to beg.

Hehehe, there's always lynx :)
Lynx is a unix non-graphical web browser. If you can somehow hook up your
atari to a unix shell account, you can run lynx on the shell.

Other than that, I dunno.

Well I don't know how to fix your problem but I can tell you that using a disk drive with the 400 is not advisable.The 400 was only sold with 8 or 16k ram which is not enough to load DOS and run programs at the same time. I had to get a 32k ram module made for the 800 for mine. You have to open the case to swap the module as the 400 does not open to expose the ram cards like on the 800. I hope you find the solution to your problem and find this info of some use.

The Sheol demo needs 320k of ram and a BB floppie drive. The new version will run on both the XL/E I ran it on a 512k Rambo, and a 576k 130XE both system have the Antic Pal chip. Its perhaps the BEST demo ever for the Atari 8bit. I have a 1 meg XL but its tied up running the BBS, Its a Newell and I dont know if it will run on that machine, The Author states that the machine must be XL compatible upgrade.

>Can a 130XE be hooked up to a SC1224 ST Monitor or Commodore 1084S Monitor?

I've got a 1084 (no "S" unfortunately. Just one speaker. On the left.) on my XEGS. If the 1084 has connectors that look like the once on you stereo (RCA, Cinch, Tulp are some of the names used in the USA, Europe, the Netherlands respectively) it will. Get youself a cable that plugs into the monitor port of the 130XE and has four of those "look like they belong on the stereo" connectors. Mine are yellow, white, black and Red. I believe I use red and black. If you have a GUMBY upgrade (two POKEY chips) and the monitor has a SCART connector, you can even go stereo. Pins 2,4 and 6. Don't know by heart which one is the ground pin on the SCART conector. On the RCA connectors, just try them out.

Cu Mathy van Nisselroy

PS on the XEGS you just need a long cable. Like the ones you use on you stereo to connect everything to the amplifier. But a bit longer might be usefull here.

>motherboard but no drives and such.

No computer in my mini tower, but...

I use it to power my BlackBox & Floppyboard, the second mech of the dual drive 3.5" conversion (by Bob Puff), 2 1.44 meg drive and one XF551 mech plus a harddisk.

My power supply (200Watts max) will run with just the BB/FB.

It did loose power in the beginning (it just quit on me), but that was because of a loose contact somewhere (just popping a 3.5" disk into the drive was enough for the Switching PSU to quite on me. Heck, even dropping it on the case form not even 4 inches high was enough).

Only when I added the last 3.5" mech did I run into problems. To much load on one 5VDC outlet. Now the BB/FB uses the wire intended for the motherboard of a PC to receive power. Everything is back to normal now. (even the RS232 port doesn't like 4.5 volt.)

Some tips:

There is a "power good" wire somewhere inthere (in my case it was orange). Forget everything you heard about it. We don't need it.

Keep the wires short and if possible use solder joints. But remember, if your Tower still has warranty on it, use connectors. That way you can unplug everything and they never know you don't have a PC (people do get very funny/stupid when they realise that). Switching power supplies loose voltage if you use long cables.

CU Mathy van Nisselroy

PS my display (on the tower) says either "130" or "8".

How do I recognise this new version?
I do have a BlackBox with just about everything on it (except 80 columns color and FAX software). And 1MB. But I use PB0 instead of PB5 (separate ANTIC and CPU banking). Shouldn't be a problem I guess. All my machines are "European versions" so my ANTICs are all PAL.

Badbob here again....
I just played around with Atari800Win's settings, and it seems as fast as
Xformer when going full speed. So just stick with Atari800Win and Mac65, and
programming for the Atari on a PC should work great. Rich seems to have added
some asm routines to Atari800Win that can make it really take off!

Thanks for sharing your experiences here Mathy, it provides a valuable bit of extra info. My comments served more to provide a caution of possible concerns. It is information I have picked up out of servicing and repair books for PCs.

Though I mentioned nothing about it you are correct the power good signal is not of concern for the Atari. Of course PC type mother boards watch that signal as a safeguard of proper power. In fact it can be used to create a reset switch for a PC motherboard that does not normally support a reset switch, but that is another story.

As to voltage dropping on longer wires when used with switching power supplies.... well that true. But then it is true with any voltage source. Longer wires increase resistance, and voltage drops across a resistance so.... :)

Never say nope!

Minix (posix compliant unix lookalike) runs well on very small computers indeed including very early 8088/86 PCs with tiny memories, and Atari 512K STs with no hardware memory management at all. Memory management is handled by software.

Only one floppy drive is needed.

If there's a will, and someone with skill, it can be done!

Check out some of the sites dedicated to the (6502) Oric computer. These guys have talked for a long time about implementing a unix clone.

Or visit Minix newgroup at comp.os.minix

Best wishes
Jerry

: <snip>
: And for the Playstation there's Colony Wars which has the same SR feel in
: space flight combat. Still, as with all other games of this type, you can
: only do one mission at a time as oppose to flying anywhere you want in the
: galaxy like in Star Raiders.
: <snip>

I get excited every time I see the commercial for this. I finally got the chance to rent it, and it's pretty awesome! :) (I can't compare it to the Star Wars and flight sim. games everyone's talking about, since I've never played any fo them (except Rebel Assault which was just dumb :))).

The game play is pretty intense! :) For being a full 3D game with lots of controls and those crazy PlayStation controllers, I've found it extremely easy to get the hang of.

The game is mission-based, so I can see it get boring quickly, especially after you beat it, but the cool thing is, as you do well or poorly, the missions change.

You can upgrade your ship after successful missions (adding a little extra to your boosters, a little more shields, etc.) The interface is extremely simple, which is good... I like games where I get to play, not ditz around trying to pick the perfect engine. :)

Different missions provide different special weapons. I like the grappler. You normally use it to move things around (move the radioactive cores away from the space station before the radiation level gets too high... or pull parts of an automated gun turret together), but you can actually grapple onto enemy ships and pull them around with you (or vice-versa :)). Insane! :)

If WipeOut&WOXL, Twisted Metal I&II, Tekken II&III and Vigilante8 weren't enough to make you fork out $130 for a PlayStation, I think this game just might.

Now if only we could do this on the Atari 8-bits! :)

Ok, I've got one for you. I've been looking for an ATR of The Halley
Project. It was my sisters favorite game on her old 8bit. I'm
upgrading her PC and wanted to surprise her by running it with
AtariWin, but I haven't found the game anywhere. If you can conjure
up that one, then you really are Batman....

Thanks
Dave

I agree, the game so far doesn't match the hype in the catalog ad.

I haven't actually tried it but if I read the manual right, the Sony PlayStation can do this. (yes, I did actually read the manual but it was for how to hook up multiple units :)

I've got that game for my old 8-bit (going to my dad's house after the semester is over and check out what I call my "Atari Room") but I could never figure out how to play it. If I had a SIO2PC cable....

Howdy folks

This is a wee bit off topic but.....

Does anybody have the schematics to those speakerphones?

I've seen speakerphones in the RadioShack catalog, but 24 US Dollars is a wee bit to much for I thing like that. And that's without postage to the Netherlands.

They looked a bit old fashioned. Maybe that means that they are sturdy/unbreakable/not like todays cheap stuff.

Howdy John

>As to voltage dropping on longer wires when used with switching power
>supplies.... well that true. But then it is true with any voltage
>source. Longer wires increase resistance, and voltage drops across a
>resistance so.... :)

With switching power supplies, you loose more power over a lenght of wire than with "normal" switching power supplies. Seems to have something to do with the fact that you don't really get a constant 5VDC signal but something that looks like it. It's a high frequency thing. Voltage jumps up and down (lie a square wave form) so fast, it looks like 5VDC to you computer.

I used to work at shack, I have a support connection CD maybe the schematics are in that - dont waste your money on the phone, it really stinks. It looks old fashioned because it IS old fashioned (and breaks easily, too).
They havent changed the design for over 20 years.

4893. For Sale: Atari 600XL

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-09 00:00:00 UTC
From: Scott and Doug Craig <csc5sdc@erols.com>
Message-ID: <01be23cf$55075960$3d56accf@default>
Source record: 57561

Hi, guys!

I recently purchased an Atari 600XL never used. All of the components were wrapped in original wrappings (even the rubber bands around the cables, which disintegrated when I unwrapped them). The only thing missing was the owner's manual. All warranty info and the BASIC book was in it.

Anyway, I opened it and set it up and I can't get it to work. The power comes on but no screen. I've tried numerous things and the thing won't work. So, I'm offering it for sale.

I'm sure it's still good for parts. Hell, the unit might be fine but the cables might be shot.

I paid $10.44 for it, including tax (9.99 + 4.5% sales tax). I'd like to sell it for that much, plus shipping. I figure shipping will be around $6 to $8 via the USPS.

Please reply if interested.

Thanks,

Doug

Hello everyone!

I have the following atari Compute's books for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Compute's first book of atari games"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each
plus shipping. I would suggest the 3 day shipping as it is only $3.00
and gets the books to you quickly at a reasonable price. Please e-mail
me if you are interested in any of these. Thanks!!

4896. Info on HP Portable Plus laptop?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-10 00:00:00 UTC
From: Nick Kennedy <nkennedy@cswnet.com>
Message-ID: <74pkshgnk1@news.csw.net>
Source record: 57488

First, what's this got to do with Atari? Well, this computer was sold by Atari vendor American Techna-Vision, and I bought it thinking it'd be a good file server for the Atari, since it has a 1 MB non-volatile ramdisk. Maybe others did the same.

Anyway, it was provided without documentation. It doesn't have a disk drive but does have a serial port. Unfortuantely, the built-in communications software is some kind of HP proprietary thing.

Does anyone know what protocol will communicate with this thing? Does anyone have any technical details, such as the port address of the serial port and whether the serial chip is the same type as used in a PC? (8750 or whatever that chip number is ...)

Thanks,

Nick (The SIO2PC guy) Kennedy

4897. Atari? Why Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-10 00:00:00 UTC

Cause Atari was my FIRST computer (800). It was great. I upgraded to a 130XE when it came out, then 520ST in 85. Now, I have a 1040STE, a semi-dead 520 (yep, the 85 I bought) the 130XE and a 800XL. All but the 520 work fine. I do use a PC, but I have more software for the Atari's.

LONG LIVE ATARI

Atari:Its not just a computer, its an ATTITUDE!

4898. Atari 8-bit Auction

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-10 00:00:00 UTC
From: "Mark H. Kusz" <mkusz@tir.com>

No, the 1200XL has a self-test. In fact, the 800XL's and some (if not all)
XE's still show the 1200XL function keys on the keyboard self test screen.
Sheesh! the 130Xe even has the 1200XL function key code in the keyboard
IRQ handler :)

Could you look for me (on the CD)? I'ld like to have one (ever since I first saw them). I know you can buy phones nowaday that have such a thing built in, but I like the idea that it's a stand alone thingy (even if I might have to find an old telephone to connect it to.) Building one myself seem like a good solution if these things break easily.

CU Mathy van Nisselroy

PS Tried to built me an extra buzzer for the phone a while back. Didn't work. Even went back to the electronics store. They thought it might be the Capacitor, I thought it could be the transformer. It was the Zener-diode. I installed it the wrong way. Now it works.

"new design" 130XE's don't. And computers derived from it didn't have that
either (800XE and European 65XE).

Bob Woolley might have 1200XL ROMs. He replaces his with 800XL ROMs.

if you have a true square wave, you are talking AC not DC are you
sure that you are not thinking about a pulsating DC here. also
when you produce a square wave there is alot of noise produced,
because of all the harmonics produced. I really don't think that
this is something that one really wants or needs inside their
computer case.

> CU Mathy van Nisselroy

"With switching power supplies, you loose more power over a
length of wire than with "normal" switching power supplies." this
statement doesn't make sense! Are you saying that there is
abnormal switching power supplies? how do you loose more power
with a "switching power supply" than with a " 'normal'switching
power supply" Or are you saying with a regular power supply you
loose more voltage than with a switching power supply

Oh god I must have Queer electrons in my computer.....they
keep blowing the fuses.

You dont have to connect a phone to it, just plug it in. It can
operate alone.

Actually I think the 1200XL has BOTH the self test and the logo. I
forget how you get one or the other though. The other XLs are self
test only and the 400/800 have memo pad only. That logo the 1200XL
has is in like 128 or 256 color too!

4925. Atari800Win 2.5 keyboard joystick does not work

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-11 00:00:00 UTC
From: 101.126624@germanynet.de
Message-ID: <74qsil$9d4$1@newshost.germany.net>
Source record: 57493

Unfortunately, i cannot use the emulator. Loading an .atr works fine
but the keypad does not work as the joystick (but configured that
the keypad should be stick 1).

Any ideas?

Mike

> I'm looking for the autor of the SHEOL demo.
I'm one of the authors.

> First I downloaded the demo from his site. It turned out to be an ATR file.
> Most Eastern European demo's are DOUBLE density.
Yes, because almost all Atari disk drives use DD. Only bare 1050 didn't
recognize DD, but everyone should have upgraded 1050. Upgrade costs less
than a pizza, so... no comments...

ATR file is a disk image with 16 bytes header, but you can easly convert
ATR into DCM or XFD using Imagic by Steve J. Tucker (cool program)

> Now I download a version of SHEOL from a Dutch BBS. It tells me it needs 256kB
> RAM. Man I HAVE 1MB.
That's not my fault... My friend who is also the author of SHEOL said
that he will do this demo for memory upgrades uncompatible with 130XE,
because it is more popular... I told him, that demo should be compatible
with 130xe not any lame upgrades, but... I couldn't do anything...
The whole problem is with bits. Demo uses bits 2,3,5,6 for bank select
and bit 4 for XMS enable.
130XE ises bits 2,3 (modified models also bits 6,7) and bits 4,5 for XMS
enable, but(!) separately for Antic and CPU!

> Every piece of software I tried it with sees atleast
> have of that. Why not sheol???
I've just explained that.... I'm really sorry about that.... Be sure
that any next prodict of me! Will be runable on 130XE compatibles. I
can't to command my freind to do the same, but I'll try....

Greets,

Alex

4927. Atari Disk 5.25" Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-11 00:00:00 UTC

Hello. Could you please let me know if there is an application affording possibilities for reading ATARI 8-bit 5.25" diskettes in IBM drives? I've got ATARI old games and programs and I would to enjoy them.

There shoud be drivers enabling it but I cannot find. Please, help me!

If you are the one who may help the guy in need, please send a message to: maito:yaruk@friko6.onet.pl

P.S. ATARI IS THE BEST!

:
: It's possible to create Atari Game database. I've got the lists in CSV
: formats so that it is relatively easy to write simple Perl cgi for
: database access thru my web. Is anybody interested in it?

Hi! Why not submit your site to XL Search? Simply convert the CSV file
to QIF format (tab-delimited file containing filepath/name, file date (YYMMDD),
file size, and description), place it on your website or FTP site, and
tell me and I'll incorporate your site into the database.

To see XL Search, go to:

http://xlsearch.atari.org/ <- note new simpler URL!

or e-mail:

nbs@sonic.net

with the subject:

xlsearch

(all lowercase, exactly as you see it)

You'll immediately receive a help file on how to use XL Search via e-mail.

Hmmmm...seems ok my end under Win98..

I just changed the Joystick to Keyboard and left the Stick 1 option
alone..

Played Mr Robot using the 4 & 6 keys for left and right and the 0 key
for Jump.

Make sure the Num lock led is lit otherwise the numeric keypad won't
work. Let me know the results...

Cheers

My atari 130xe went down in a recent lightning storm.

If someone can sell me a power pack for it, it will be up again.

As storms are common here, I vow to use a surge protector from
now on.

Please contact me at my email address: DougJett@CompuServe.com
with product, shipping and pricing information.

Thank all of you for your help.

This is a known problem that will be corrected shortly. I didn't catch it
because it only occurs on systems that have no DirectInput devices at all, and
all of mine do.

Any good 5v regulated DC source will do as the 7-pin Atari DIN plug is fed by only two wires. Assuming your old power supply is unrepairable, cut off the wire with the DIN plug as close to the old supply as possible and connect it to a new supply that pumps out at least 1.5 amps (the wire with the white stripe goes to positive).

I'm currently powering two XE's off the +5 line from an old 286 power supply and running the +12v through five heavy-duty diodes to provide +9v to a MIO and a XEP80. That leaves tons of power for a SCSI hard drive mounted in the 286 case (which might actually work when I write the required code to use 512 byte sectors).

The simplest hook up for +5v is off the red and black wires going to one of the four identical drive power cables. Considering the XE needs less than 2 amps, you could safely just tap into the supply for any PC i.e. you really don't have to go buy anything assuming the 130XE is within wire's length of the PC.

John

Specifically, the code in the MIO ROM to access hard drives is written to handle sectors of 256 bytes in length and it's almost impossible to find a hard drive or hard drive work-alike (ZIP etc.) that uses anything other than 512 byte sectors. What I'm planning is a software driver to use the MIO hardware but bypass its ROM to allow use of modern SCSI devices with the MIO.

Don't hold your breath for this to arrive as it's going to take a while to sort out what exactly I want the code to do and how it's going to do it. One thing I do know is that it will most likely be for SpartaDOS 3.x only as I don't have info on SpartaDOS-X .com file formats and I rarely bother booting any other DOS.

A owner/user of C64 and Atari 8-bit chimes in:

Best Atari game: Rescue on Fraculas, Best C64 game: Impossible Mission.

Well take a look at the attached URL, maybe a port to the ATARI is
comming, but for today its a C64 entity.

http://hld.c64.org/poldi/lunix/lunix.html

All in fun, indeed.

4960. Re: Where 8-Bit Atarians are from, etc.

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-13 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <36742598.761C@geocities.com>
Source record: 57528

Well, this is as good a time to introduce myself as ever.

I have grown up in the Dallas, Texas area all my life, and was encouraged to buy my first Atari 400 in roughly 1982 after I saw a friend who had a Atari 800. After that, I was hooked. We traded warez and all was cool.

From that point on, I was on the Atari BBS's from 1985-1989, and enjoyed the Atari fandom of the local Atari groups (Dal-Ace).

I did the college thing, got a Macintosh (since I didn't realize that the Atari TT, and Falcon were released) and would find, much to my surprise, that there was still a Atari group in the Dallas area (Atari Users of North Texas - A.U.N.T.)

So after being gone for 9 years, it's fun getting back into the Atari scene yet again.

(And if anyone here is from North Texas and would like to find out more about the our local Atari group.. just let me know...)

BTW, for any of you that might need a power supply for a 2600, XEP80,
or SX212, I have tons of power supplies that will work with them.
(maybe someday I'll reveal the story on how I got them).

But for a few days and shipping I could ship one out to anyone that
needs one.

As for the SX212... I got one recently in a used computer store. Now,
a 1200 buad modem doesn't seem to even get recoginized by BBS's running
with 14.4 and 28.8 modems. However, I'm still curious, what modem
software would run it off the SIO port on the 8-bit?

At the Novmber meeting of A.U.N.T.(Atari Users of North Texas) a
Falcon040 and a Atari 400 were set up side by side. We showed off the
various bits of fandom between the two systems.

Then we showed off the 8-bit Star Raiders and the ST version on the
Falcon. One thing was quickly agreed by everyone present...

The explosions, the animation, the sound, and the game play of the
Atari 8-bit were declared to be superior. :)

What raised the eyebrows most was the photon torpedos and the
explosions... oh, and going into hyperspace.

Yep, the 8-bit version rules overal. :)

Parts of interest quoted from Dave's message:

> * 5200 Version-
> Basically the 8bit version, with some very minor graphic enhancements
> (you could see the ship type in the long range scan, the original just
> showed a blip)...

*===I==================------

I wanna ram version of this! To matter the fact, if someone would port this over to the Atari computer from the 5200 and then put it in cartridge form.,.. I would be in heaven!

* * *

>
> * Star Raiders II for the 8bit computers-
> More of a sequel than an update, it was an interesting game with
> somewhat better graphics, but still not as exciting or challenging as the original..

*===I===================---

I first played a copy of this one when it was "The Last Starfighter", and personally, I think it is better that way. As "The Last Starfighter" it is better... as a Star Raiders sequal.. well, it does good enough to be on everyone's favorite list, but it still pales in comparison.

* * *

> Vaporware versions-
> Star Raiders 2000 and Battlesphere for the Jaguar
>
> dwebster@mediaone.net

*====I=================----

Why re-invent the wheel? The programmer made a awesome piece of code that is frankly unbeatable. Why don't we ask the programmer for permission to the code, then alter it. We keep the great explosions, hyperspace, and photons...

Then we could ADD more controls... to life support, add other weapon systems... we could boost the game from a 8K cartridge to a 16 or 32K cartridge... think of what we could add to the existing code?

One fun idea that would probably expand it beyond a cartridge form is to have MULTI-PLAYER STAR RAIDERS. Could you image fighting a live

combatant in that game?

What do the rest of you in the "Star Raiders Academy" think?

I won't post game files on the site. I'm afraid of doing so, because
it's my company site...

Game Database would be useful for collectors - it's just the description
of the game - name, coder, musician, company, year, etc...

The Atari 800. The Hippo of the Atari 8-bit realm. I've always dreamed of owning one, and I am currently fixing and soon with a few spare parts, will work to upgrade it.

I know the 800XL and 130 XE are the computers of choice, but the Atari 800 has a look and feel I love!

(The Atari 400 is similar, but makes a great game system...)

Sooo... seeing that I like cartridges, and the Atari 800... how might I put that "Right Cartridge" slot to use? I want to slap SOMETHING in there.

Besides, it will make the 800 look more cool for the Atari meetings!

And while we are on this note, does anyone have a Atari cartridge CASE for the Atari 8-bit that says.. "RIGHT CARTRIDGE" on it?

Doctor Clu

Try playing about with the keyboard too. Pressing the space bar (I think!) will take you to the galactic chart. From the you can jump to other planets, to star bases (for repairs/more fuel/more bombs) to the star (for more fuel, but don't hang around too long!), to enemy squadrons, or the the enemy system (top left hand corner). You select where you want to jump to by moving your joystick (or whatever you're using) around and a line will appear from your craft's position to the destination. When the line reaches a valid destination a circle will be drawn around it, then press fire and you will warp to that destination.

When attacking the enemy system, the main aim is to destroy their factories (that are making all their attack squadrons which are invading your system), for that you need to switch weapons, which I think you do with the W or X key (can't remember for sure now), a cross hair will appear over the planet's surface, and the you drop a bomb by pressing fire. To win you need to destroy all their factories and attack squadrons before they destroy all your cities.

4978. Re: Star Raiders II instructions?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-14 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <36751FD8.676EC92E@erols.comX>
Source record: 57450

I just finished playing this game:

Press the Space Bar to get to the galactic chart and choose a hyperspace destination

Press 'S' for shields

When orbiting a planet press 'W' to switch between ground based and space based attacking.

The object is to destory all the Zylon(??) cities and fighter squardons before they destory your cities. When you first start out you are in your galaxy. You need to hyperspace to the Zylon galaxy to destroy their cities. Watch your shields/power. Eventually you'll need to dock at a space station(in YOUR galaxy) to refuel.

Thats it.

I meant to say normal power supply. NON switching. They loose less power over
a certain (could somebody please tell me if I spelled the right "certain" here,
or if I'm talking about the piece of fabric hanging infront of your Windows.
Hmm, wouldn't be a bad idea. :-) but back to "serious mode") lenght of wire
than switching PS do. Atleast that's what I keep hearing.

A very, very, very long time ago, I read a message on the CSS BBS (back when the SysOps still checked in on it. Heck, they had TWO SysOps.) that somebody had sent in his MIO for repairs and when he got the MIO back from ICD, the BLACKBOX (not the MIO) could read the harddisk that was on the MIO no matter what the MIO-compatibility what position the dipswitch was in. On solution that was mentioned was that the MIO might have been upgraded to support 512 byte sectors. But I'm not sure. The MIO also inverts data that is send to te SCSI bus, whe the BlackBox doesn't. Maybe the MIO was upgraded to handle non-inverted data. I don't know. You might wanna ask ICD! Or Mike Hohmann.... (via Bob Klaas?????)

>running them.

I've never seen any of it, but the ABBUC magazine mentioned a mailing list that
was intended for discussions on the ANIX project which is/was supposed to be a
UNIX version for te 8 bit ATARI. (don't fight with me on this one. I only
know what I read in these four lines of text here. To receive it, mail to:

majordomo AT zwieracz DOT pse DOT pl

put:

subscribe atari8-l YOUR-EMAIL-ADDRESS

in the BODY of the message, NOT in the subject.

Source record: 57457

Howdy folks

Could somebody please tell me how big a MIO (case) is? Physical size please.
Height, Length, Depth. How much smaller is it on the inside? I guess it will
be just a wee bit to small for my plans, but I do wanna know how for sure.
So.....

How big is a MIO?

Howdy folks

A while ago, Curt Vendell place a message here telling us that he had found a place where they had stuff that Mike Hohmann had left behind. Like Atari cart shells and empty MIO cases and stuff.

Do you know what they cost?
How much is/are available? (= should I decide fast?)
Are these the new grey cart cases or the old brown things?

CU Mathy van Nisselroy

Dreaming that a MIO case might be just a wee bit bigger then his XE.

About 1.5 x 9.5 x 6 inches (4 x 24 x 16 cm) on the outside. Never opened either of mine, so I don't know inside dimensions, but judging from your other message, this is way too small, anyway...

Source record: 57465

I have a couple hundred 5.25 inch low density floppy disks which are Word Perfect 5.0 disks. I am selling them for 10 US cents each, ie 100 for 10 US dollars plus shipping from Canada.

The disks are used commercial Word Perfect Master disks which should work fine with Atari 8 bit computers.

My wife says that the following stuff must go! All of it has been boxed up in their original boxes for several years. All of it was in working order when I put them back in their boxes.

Atari 1200XL
Atari 1050 Disk Drive
Atari 1030 Modem (300baud, not sure about the model number as I am writing this from memory)
Canon PW-1124 dot matrix printer

All manuals are included, also some books, and some software. (You get all of my 8bit Atari stuff!)
I prefer that you pick up these items at my house in Chaska, MN. I do not wish to ship these items.

Please E-mail me for more information.

Mike Dillon (mdillon@fluoroware.com)

Well, I definately plan to see (with the help of the other folks here)
if Atari ever made a right hand version. Soon we will know! :)

As for Monkey Wrench, how did it work from the right hand slot, and
certainly not all copies of Monkey wrench were designed to work in the
right hand slot.

Curiously,

Clu

they are 1 1/2" tall, 6 1/2" deep, and 9 1/2' wide as I just measured.
BTW, the height is including the feet which are 1/8" high so the MIO
is really 1 3/8" high without it's feet.

Turn $6.00 into $42,000...Hey it sounded crazy to me too. However if
you're interested in taking a $6.00 roll of the dice I KNOW you're

going to be very surprised cause I was dumbfounded!!!!
READING THIS COULD CHANGE YOUR LIFE ALONG WITH 3 HOURS OF YOUR TIME,
$6.00, 6 stamps and a spontanios call to action!
I found this on a bulletin board and decided to try it. Just a little
while back, I was browsing through newsgroups, just like you are now,
and came across an article similar to this that said I could make
thousands of dollars within weeks with only an initial investment of
$6.00 and 3 Hours! So I thought, "Yeah right, this must be a scam", but
being involved in marketing and advertising I know how much corporations
will pay for fresh mailing lists.
So like most of us, I was curious and kept on reading. Anyway, it said
that you send $1.00 to each of the 6 names and address stated in the
article. You then place your own name and address in the bottom of
the list at #6, and post the article in at least 200 newsgroups.
(There are thousands) No catch, that was it. So after thinking it
over, and talking to a few people first, I thought about trying it. I
figured: "what have I got to lose except 6 stamps and $6.00,
right?" Then I invested the measly $6.00. Well GUESS WHAT!!...
within 7 days, I started getting cash in the mail! I was shocked! I
figured it would end soon, but the cash just kept coming in. In my
first week, I made about $25.00. By the end of the second week I had
made a total of over $1,000.00! In the third week I had over
$10,000.00 and it's still growing. This is now my fourth week and I
have made a total of just over $42,000.00 and it's still coming in
rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
than that on the lottery haven't tou done the same? I am now investing
another wopping $6.00 and doing it again so just go for it cause you'll
blow $6.00 on smokes , drinks or lottery tickets looking for some form
of
pleasure. I'm confident that as the weeks go by you'll start to see
why
some people say making money is easy if you know how. One thing I'd
like
to
request is as the money starts to come in please find an oganization
Like
your church,
the YMCA, YWCA or a soup kitchen to give some to. Hey it'll make you
feel
good
in ways I can't discribe.
Let me tell you how this legal opportunity works and most
importantly, why it works....Also, make sure you print a copy of this
article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you
will start making more cash than you thought possible by doing
something so easy!
Suggestion: Read this entire message carefully! (print it out or
download it.) Follow the simple directions and watch the cash come
in!

It's easy. It's legal. And, your investment is only $6.00 (Plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!!
If all of the following instructions are adhered to, you will receive extraordinary dividends.
PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the cash made from the mailing lists is secondary to the income which is made from people like you and myself asking to be included in that list.
Here are the 4 easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

#1)Robert Riker
1187 Marques rd
N. Charleston, SC 29406

#2)Matt W. Forrest
119 Victoria St. Apt. 2
Woodstock, NB.
Canada E7M 3A4

#3)Rob Williams
4265 Bond st.
Burnaby, BC
Canada V5H 1G3

#4)Brad Riddle
12613 W. Arrowhead Dr.
Daleville, IN 47334

#5)Donald Moulder
2620-B Stennis

Lemoore, CA 93245

#6)Matt McNeal
1708 hampstead/mexico ,rd.
westminister MD 21157
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more cash you make!
This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need cash, you can use it again, and again.
PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the cash that so many others have received will come your way.
NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)
So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of cash in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------
Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new

message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE CASH YOU WILL
MAKE!! BUT
YOU
HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving cash from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES
ARE
CORRECT.**
Now the WHY part:
Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625.00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the cash? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will really work. Just do it. I promise you that it will give you something to look forward to
because as the days go by and you're at work coming home you'll be curious

to get there and look in the mail box. After the first few dollars roll
in
you'll see what I'm talking about.
May you always reach for the stars and in them realize your dreams.

Did the right cartridge have more ROM power than the Left Cart. or
something? If that was true, Atari could have made a more advanced
version of Basic.

All the MWIIs were definitely for the right slot, because the BASIC cart needed to be in the left slot. MWII is a bunch of BASIC programmers tools.

I looked in some old magazines I have to try and find an ad for the original MW, but I couldn't, so I can't speak definitively on that, but I believe it was a similar package that needed BASIC in the left slot.

Jeff

These are a little rough because I can't get an accurate measurement
without disconnecting it and then having to re-boot and load about 500k
worth of stuff into the RD's:

Length: 24cm Width: 16.5cm Height: 4cm.

re. How much smaller... ?

Not much.

The external ribbon connector is about 10cm long and requires an adapter
for use with a 130XE to fit the "Enhanced Cartridge Interface" (Atari
doublespeak for "Save a few cents by omitting one port.")

Y2K should not be a problem for the R-Time 8. The only adjustment that
needs to be made is in the code that calculates day of the week and that
code is in SpartaDOS--not the RT8 itself. Version 3.2g already has the new
code.

The right cartridge is/was nearly identical to the left. It occupies the address space from $8000-$9FFF and therein lies the rub: Knock off another 1K for the screen and about 8K in low RAM for the OS and DOS and you don't have much RAM left to actually do anything useful.

I believe the AtariWriter cartridges were 16K occupying both the left and right address ranges; but the OSS bank-switched cartridges are far more useful. Action! for example, packs 16k of code into 8k of space.

I'm going nuts! Either I'm getting too old for this sort of thing or... I'm STUPID!!
Anyway, can anyone offer me a CLUE as to how I'm going to be able to move all the .DCM and .ATR images off my HD and onto a 5.25" diskette that my Happy-enhanced 1050 can read? Yes, I could build/buy an sio2pc, but don't have time right now to build it. I've grabbed nearly every Atari file from UMich, and checked the programs that are supposed to work, but they aren't cooperating.
Firstly, I can format a 180K disk in DOS mode (pre-load of Windows98), but I cannot format a disk 180K once I'm *in* Windows98 (dos-window, etc.)
Secondly, I use the latest version of Atari800win, but it isn't 100% compatible with some of the files I've been running, so I obtained a 130XE (stock) and Happy 1050, which is supposed to support 180K according to the info I grabbed from a couple reliable Atari sites. I've been looking forward to setting things up for my son, but until I can conquer this roadblock, I'm at a standstill.
Aside from the sio2pc, which in my opinion will be awesome, how can I get the 5.25" of my PC to write Atari diskettes. And can I initialize a DOS diskette the same route (since in my rush to get home with my "new" 130XE I forgot about getting DOS diskettes to boot the thing with, sigh!)? I have all the various DOS dcms/atrs for SpartaDOS and MyDOS, et al...
PLEASE!!! Can anyone offer assistance?

5013. Check it out!!!!

I am emailing all Atari related sites/newgroups to check out my new page I am working on at http://papabyrd.atari.org

It's an Atari Commercial Archive! If you have suggestions or if you have a commercial that I don't have, please let me know so I can get it from you and post it online with a a review. I always wanted a complete site to go to get this stuff and I always found it scattered around a bit, so I figured it was time to do something about it! This site is not totally complete however all commercials are online and it works OK. I need to optimize it for Netscape, so try to use Internet Explorer if you can, although Netscape works fine too, it just looks funny (need to work on that).

That's my disclaimer, other than that, send me your comments!

Thanks,
scott@papabyrd.com

(Clu asks what software will run sx212 out of sio port.)
I go sxexpress, Keith Ledbetter's term program, pretty good.
Then there's Jim Dillow sx212 handler, which I bet will
allow running Bob Term, Ice T, or FlickerTerm. I have another
sx 212 handler also, so, with the right handler, you can
run any A8 '850' type software.
Russ

Oh, about sx212 sio term software. ALSO.
I got this program, INSTALL.BAS called 'Jack the Ripper
Handler Install'. What it does, if I figure right, I think.
It takes the R: handler out of just about any term software
so you can prepend your own handler. Actually I think it
takes care of prepending your chosen handler.
(Author Zonker Harris, wonder if any relation to John Harris?)
Oh. Like BobTerm, Ice T, maybe also FlickerTerm. Depends
what you get. If the term program you get has the R:
handler built in, then you'd have to remove the handler
and install either separately, many at boot, or
prepend your new handler.
I sorta collect R: and T: handlers (T: was for the
1030 modem, I think.)

Yep, that's the one thing the various 8 bit PC emulators have not been
able to duplicate, the 'sparkling' photon effect. BTW, that effect
was one of Doug Neubauer's favorites in the game also.

> Yep, the 8-bit version rules overal. :)

: version of Basic.

: Laters,

As far as I know, the right cart was included as 8k carts were about the biggest around back in the day that the 800 was sold.....the idea was to have two 8k carts for a whopping 16k program. When memory prices fell, it was a moot point. Rtime 8's and such piggyback and therefore can work in the right slot. Of course, you really cant close the lid with an ICD cart case in a slot. I think you could plug Sparta X into the right slot and have it work as well....I think I remember doing this in the past but cannot be sure.....don't take it for gospel.

And, with regards to the R time....was there not a y2k fix for the rtime with the FTE version of Sparta dos? Not sure....just remember hearing something about a possible fix.

(Wants to format and write DOS to 5.25" disk in PC for use
on real A8.)
I got a proggy does that.
I think it is the only proggy does that.
'Util' or 'MyUtil' will format a 5.25" double density disk for
or rather writing VTOC, but doesn't put DOS DUP on the disk.
Mine does, either SpartaDOS or MyDOS.
BUT, my proggy is sorta not been tested much.
Why not just get a DOS disk from somebody in your vicinity?
Russ

Another important 16k cartridge is Logo. The 16k cartridges caused
sport in an 800 if, like me, you had an Axlon board in the 16-32k slot
in an 800. The ram-disk software would cheerfully switch the screen,
including the display list, into the nether regions when
bank-switching to get at the disk data.

I don't know enough about the BlackBox to comment on most of what you said but as to upgrading the MIO: you'd need to replace the code in the ROM or EPROM and, as to inverted data: as far as I know, all SCSI devices use inverted data.

Tom Baker was good, but seeing the total crap that the BBC used for
props, music, plot... only someone like Jon Pertwee could the show
interesting... much less have it survive.

(Case and point.. the Sea Devil episode... that has to have had the
WORST background music out of any sci-fi show I've scene yet.. and after
seeing Space 1999... that's saying a lot!) :)

Seems while many in the Atari world are heading towards zip drives and PC connections, I've actually taken a step backwards. I have been having fun playing with the aspects of the Atari that other computers would not continue. The cartridge, for example.. a wonderful hardware idea that save wear and tear on disk drives, and makes your favorite program an immediate part of the actual MOTHERBOARD.

Now there is something else I'm wondering about, and back when I was into Atari for the first time, I never cared to ask what I will ask next. For you see, disk drives were cool, fast, and overal, less of a drag than cassettes.

But you know, now days I try to conserve my poor 1050's (being over a decade old) and yes, cartridge forms of programs I use a lot helps greatly. And then there are cassettes... another form of storage. If a cassette drive croaked... who gives a smeg!!

And so with this in mind, I have a few things I'm curious about..

1) How in the world do you save anything but a basic program
on a cassette?

2) If the average Atari disk holds 90K-180K depending on
format type.. then what would a cassette hold? Has
anyone ever wondered the storage capasity of a 30
minute tape? How about a 60, 90, or 120 minute tape?

3) With that last question in mind, (and here is the kicker
above all) could a primitive disk backup system be
devised for the Atari cassette driver. :)

Don't laugh (too much) I'd really like to know the answer to the above questions. (grin)

Doctor Clu

(I think I heard somewhere that a cassette management program, similar to "DOS" was once written. It would be interesting to see that in action... and could probably eat dinner while I wait...)

> 1) How in the world do you save anything but a basic program
> on a cassette?
I assume you are talking about boot loaders. you have to open a channel to the cassette OPEN #4,4,0,"C:" use a lot of PUT #4,DATA to write the data to the tape and then issue CLOSE #4. The initaial block must follow aset pattern, somthing like Blockcount, Load Address, run address, data. the first number is an 8 bit count, then followed by two 16 bit addresses then the 8 bit data. This data is the actual program. you can intially only load 256 blocks from the cassette. To load more you must wirte a program in this 256 blocks to load the rest of the data you require.

If you only wanted to write data for uses in your own program use the OPEN/PUT/CLOSE method above but then rewind the cassette and use OPEN #4,8,0,"C:" followed by GET #4,DATA to retrive the data and a CLOSE #4 to close the cassette

> 2) If the average Atari disk holds 90K-180K depending on
> format type.. then what would a cassette hold? Has
> anyone ever wondered the storage capasity of a 30
> minute tape? How about a 60, 90, or 120 minute tape?
firstly forget 120's they a far to prone to tape strech. I used to fit about 6 or 7 (fair sized) programs on a C90 (one side), so thats about 14 games in total. I would esally get double that on a enchaced density disk. I could always cut a notch in the disk and flip it to the use the back side.

> 3) With that last question in mind, (and here is the kicker
> above all) could a primitive disk backup system be
> devised for the Atari cassette driver. :)
I have never seen any software to do this but I don't think it would be practical see above. Also you have a disk anyway (or why back it up) so it's a lot easer/faster/more secure to just make a duplicate.

> (I think I heard somewhere that a cassette management program, similar
> to "DOS" was once written. It would be interesting to see that in
> action... and could probably eat dinner while I wait...)

I used to have a copy of this it was calles ACE (Atari Cassette Enhancement). it was very nice idea. allowing all the usuall thing missed out of the Atari Cassette handler, like naming files, BLOAD, BSAVE etc. it was nice becuase you had three levels of operation each giving more facilities but using more memory. Even the loader was cool as it cycled the colour palette during the inter record blocks (quite novel for the time). I think I still have the cassette somwhere but I don't think it loads any more:-(

Oh this rocks!!! I managed to get a Monkey Wrench II cartridge from
someone without he case. I had tested it on my Atari 400 and 800... no
luck. I had tried the Monkey wrench in the right hand slot. The
computer crashed.

Then I put basic in the left hand slot and Monkey Wrench in the right
and got a prompt...

READY

THE MONKEY WRENCH II
COPYRIGHT 1983 BY
EASTERN HOUSE SOFTWARE

.. hehehe... this rocks! I've never used the right hand slot before.
Alright... so now that I have the thing up.. anyone have a scanned copy
of the cartridge lable I could download.. :)

(And I need to find some docs to this catridge...)

I've seen at least two cassette OSes. Polish KOS and some other program
I don't understand. It was used here because nobody owned disk drive.

There were also special "Turbo" modifications of tape drives, together
with lots of programs and TTDos which implemented B: device for work
with such turbo modes.

Hell-o!

I've got XF551 and Zork I on original disk. The disk is double sided,
but one has to flip it over (XF551 is only single sided AFAIK). But
there's only one index hole in the disk. How does that thing find start
of track?

>of track?
>

The XF doesn't need the index hole to read the disk. It is only needed for the formatting process. While formatting, sector syncro patterns are stored on the disk. Every sector has its own syncro header.

The XF calculates the track number for every sector must be read (or write), then it scans the track till it finds the sector syncro header. Therefore you dont need to know where the 'start of the track' is.

All sector positions can vary, so it is possible to place the sectors in any order at the track. If the sectors are placed in a special order to increase the access speed it is called interleave.

hope this answers your question,

bye, Andrï¿½.

oops looks like a typo there, that should really be
OPEN #4,8,0,"C:"
for write (you'll hear 2 beeps telling you hold down the START and
RECORD buttons on the tape deck). Also if you want the short
inter-record gaps use
OPEN #4,8,128,"C:"
it will take up less space on your tape, and things will save/load faster.

> If you only wanted to write data for uses in your own program use the

that should be
OPEN #4,4,0,"C:" for reading or OPEN #4,4,128,"C:" for short inter-record gaps.

How about backing up your cassettes to other cassettes? You can do
that in a standard twin deck cassette recorder.

>
> Clu

There is only ONE reason why the RTime 8 works in the right slot:

It only occupies a couple a bytes in the $D500-$D5ff area.

Right cartridges have can only address on 8kB area, not two like the Left cartrdiges. Pop a Right cartridge in the LEFT slot and the computer will clear out WRONG 8kByte section. From them on, all kinds of things might happen (I don't know yet, how this precisely works). Maybe the computer places the software in the wrong section, of the cart starts looking at the wrong section and/or the wrong section of RAM might be switched out.

CU Mathy van Nisselroy

PS nothing a small adaptor board couldn't fix. BTW the is also a RW_LATE signal used on the RIGHT slot. Maybe one could use the LR/W in XL or WRT in XE machines.

In the sacred domain of comp.sys.sinclair didst Doctor Clu <clu-da-bard@geocities.com>
eloquently scribe:
: Hey, Troughton was quite good. Actually they all were. But don't tell
: me you didn't like Sylvester! Common.. it was like Tom Baker and
: Patrick Troughton with a litte William Hartnell rolled into one!

Some of his later stories were OKish...
the last two [TV Series] doctors were REALLY let down by the writers.
I mean really, an evil Bertie Basset?
What WERE they ON?

Add to that the horror that was Mel....

I'm sure the BBC were doing their utmost to kill off the series.
In the seventies, the stories could be thrilling, compelling and complex.
By the end, they were just a farce compared to their precious incarnations.

Now that is something I'd never heard of before, a modified cassette drive? What did modifying it accomplish? Double speed? So instead of taking 30 minutes it took 20? :)

Well, who can I contact to get ahold of such a program? The idea of making the cassette a B: device is actually what I'm shooting for. All and all, I think what I'd love to know is .. is there anyway to take a disk file and transfer it to a cassette.

(Figure it would be a great way to load a demo program at Atari meetings and not have to lug around a disk drive.. hehehehe...)

Aha! I've always wondered if that was possible. I think I tried that little trick in the late 80's.. and at that time it didn't work very well at all. But then again, the cassette recorders I had were pretty crummy...

Alright, speaking of which, along with making the cassette useful... does anyone remember the peek/poke command for making the cassette player a AUDIO ONLY device (where you can play regular cassettes without erroring out) ?

I know *just* how you feel -- the 800 is the machine I love (and couldn't afford first time around). Now I have four of them plus a fifth for spares.

> Sooo... seeing that I like cartridges, and the Atari 800... how might I
> put that "Right Cartridge" slot to use? I want to slap SOMETHING in
> there.
>

Mine has a SpartaDos X cart in the left slot and an R-Time 8 in the right port -- works a treat!

My machine also has 256K RAM upgrade (the one designed by Klaus B.) plus an Axlon mod so that this RAM is recognised by X. I also have a proper 'hard' reset button which comes out under the left hand side of the case where it's recessed. This little circuit generates the correct pulse to reset the machine. After a COLD /N command for example, I can bring the system back on line with a press of the button without the dreaded power down cycle (like Bob Wooley's Freezer for the XL/XE).

Now all I have to do is figure out what can be plugged in the unused backplane slot, he he...

Have fun with your new 800

Jerry

Source record: 57362

Most PC drives can only read single density atari disks with anadisk.
I used to have a dec rainbow running ms dos 2 that wrote double density
my happy drive had no problems with.

Now I use APE and an sio2pc cable almost exclusivly because it works so
much better than any of my 1050's I have a happy and a US doubled and a
stock 1050. My disks were stored for 10 years and so many of them are
unreadable. Most of the single density stuff is still good though.

All the files I could recover have been transferred to ds/dd sparta dos
atr's. It is so much more reliable than the real drives.
And the registered version of APE can do anything a real drive can do.

5044. A.U.N.T. Meeting

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-15 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <3676D512.1A49@geocities.com>
Source record: 57364

Spread the word to all Atari groups (especially to members who happen
to live in Texas)

A.U.N.T. (ATARI USERS OF NORTH TEXAS) will be having their meeting
this Saturday at the Infomart from 10 AM till a little after noon.

Bring your Atari fandom and your holiday cheer

(And if you can pick up some cookies and holiday snacks along the way,
so much the better... I think I'll bring the eggnog!)

The main topic this meeting:

The Dallas Infomart has been the meeting place of "Super Saturday" for
nearly a decade. The Infomart is a seven story glass and metal building
patterned after the crystal palace in Europe.
Super Saturday is a meeting of many computer clubs, and a large
computer basement sale.

This weekend will be the last shabang at the Infomart. After this,
computer clubs will have to find another place to meet and continue
their fandom.

And the next meeting will determine where we should move and what
direction the club will take in 1999!

A monumental occation for Atari in the Dallas area, and it would be
wonderful (if not crucial) to have those who can make it attend and give
imput.
And eat a few cookies. :)

Write me for more details!

Doctor Clu - Member of A.U.N.T.

(A.U.N.T. strangely reminds me of U.N.I.T. from Dr. Who.. hehe..)

Many thanks! I've tried it, and forgive me (since it's been nearly 12
years since I've tried this) but what needs to be done next to get the
computer to recognize the cassette drive at this point? CLOAD causes it
to error out of course.

Hi folks! Glad to be back with you after a few months. I hope to be able to stick around for a while this time...

Bishop, I agree with you RE: SR vs. WC & XW, but I'd like to point out that WC: Privateer, IMHO, is the closest thing PCs have to Star Raiders. Yes, it has a predetermined storyline, but you don't get to it for quite some time, and even though most gamers consider the plot a let-down, there's enough full-blown fighting to make Priv. a winner. Like SR, in Privateer you also have to conserve energy, manage ship damage and repairs, decide when and where you need to go, etc. You also get to interact with your friends and oppenents (albeit canned dialog -- cheesy at that), and you get to land on other planets instead of "docking" with space stations. You even get to decide what gets repaired, and how much armament you need (or can afford). The addition of a Jump Drive makes Priv. eerily similar to Star Raiders, since your individual missions are largely based on how far out of your current system you are willing to go. A long jump will usually bring in higher dollars, but you may exhaust all your resources and have to make a run for it just to get to the nearest starbase.

I love Star Raiders on the Atari, but if I can't always be on an Atari, at least I have Privateer to play on my PC :-)

Later!
Steven E. Posey, Star Commander Class 1 since 1984

I've got the docs at home. I'll try to bring them in to work tomorrow and scan them into my PC. I can create a PDF of the docs if anyone's interested, otherwise I'll just let the OCR routine do its worst and then fix anything it butchers.

MWII was my favorite tool, until TurboBasic XL came out. Still, the machine language monitor was one of the coolest gadgets I had at the time.

Stay tuned...
Steven

I once heard from Tom himself that he runs his web server from his home PC over a modem connection to an ISP, and he only allows 3 users in at a time. I believe that's still how he operates, and since he's a private individual and doesn't make any money off his site (that I know of), it's not likely that the "situation" will ever change.

I've had great luck connecting to his site during the day, USA Eastern Time (GMT -5:00), so you may want to check his site again during the GMT 15:00-19:00 hours (10am to 2pm, Eastern Time, for my fellow Americans).

Good luck, and by all means, don't give up. Tom's site is a great archive.

Years ago I saw an ad in ANALOG (I think) for a tape backup suite
(software and maybe some hardware). It used Atari cassette decks.

The major drawback to it was speed. A normal 1050 drive transfers data at
19k2 baud; the tape decks (and the OS ROM routines to support them) maxed
out at 300-400 baud i.e. over five minutes to back up a single density
floppy.

It could be done with the TRS-80 which used normal cassette decks. Atari
decks included extra circuitry, supposedly to make the system more
reliable. Considering the medium is just audio tape, you should be able to
make usable copies with any good cassette decks.

How about Elite + on the PC? It has kind of cool fighting, and
docking and stuff. Kind of like a crosse between Star Raiders and
that old BBS game "Trade Wars."

Plus it's free now.

More then you ever wanted to know, but...
Bob Wooley had showed me the sio2pc cable and software about 1989 or so at a SLCC meeting, I became a convert.

Nick's design is more kosher if you get my drift. But back around 1991 or so it seemed like ~70% of the people trying to build them were having serious problems. Not that the design was bad, rock solid, just for most people it was apparently the first time they had ever done a hardware project.

The other problem most international or people from small towns had was the had trouble finding the MAX232 chip. The chip used to be really pricey too, $6 a pop.

Since most people had trouble finding the chip, mail order places had $20 minimum, that kind of thing, I just wanted to get a chip everyone could find easily. So first round was a 4049 CMOS HEX Inverter. You may have guessed, numerous emails saying "What is a 4049? I can't find them in <insert country of choice>."

Next round was a 74LS00. Same problems + a lot of people jumped off the wall everytime someone said the one they built didn't work to say it was lucky any of them worked since it was a bad design. Everyone that posted they had a problem, I emailed them & got them up and running with remote trouble shooting. AFAIK, there has not been a single failure in either of the redesigns.

But too many people were still having problems. Too many pins had to be tied to something & a couple of passive parts like resistors & diodes.

So another week of reading data sheets & went to Radio Shack to see what they had on their shelves. Bad as they are, RS is everywhere. The 1489 was an obvious choice. Most people don't understand that it isn't really a digital circuit per se, but more like a input protected high gain amplifier. The input is diode clamped & feed through a current limiting resistor<on chip> & the output/amplifier stage has the same current limiting resistor feature. In other words, it should be impossible to

damage the chip with anything short of a lightning strike. You could still burn out your Atari by attaching the +5V to Ground, but you could do that with any design. As far as the 1489 goes, idiot proof.
The 1489 also reduces the number of componets down to the chip itself if you don't want to use a real 1050 or other Daisy Chained device with it, but I don't reccomend you do this: Add the diode.

There are other numbers for the 1489, someting like 75149, 75C149<? Been too long!!>, 14C89. The latter two are CMOS versions of the chip, sip power like economy car. CMOS is a good choice if you have access to them since they will really be efficient.

If you want an easy design, build a 1489. I have been building electronics projects for over 40 years now & I can not think of an easier one to build or one that provides as much bang for the buck.

If you are the kind of guy that refuses to smoke anything but Cuban Cigars, put anything but Genuine GM parts in your car, are practiced at the art of electronics projects, make a MAX232.

Look everywhere *but* here before you come to my web page.

www.netmagic.net/~ricortes/

It is really a pitiful site. I originally hand coded it in html, but then my son wanted to start doing web page design so he just kind of threw up some random graphics & files I had on my shell account. I gave up the site as soon as you needed a graphical browser to view it so it has sat idle for 7 years or so. Everyone elses Atari pages are much better it hurts.

(Nick, or Steve T.?)
These cables are different. The SIO2PC is a max232 and the
one chip APE is 1489 chip.
Can I use APE software with the SIO2PC cable and can I use
SIO2PC software with the APE cable?
Russ

I talked to Tom Harker at an Atari Fest, and
asked him about 512 byte sectors on the MIO.
As I recall, he said yes, the ROM code could
be modified to read 512 byte sectors, but
went on to say that Sparta Dos could likewise
be modified to do the same thing. Perhaps
I misunderstood him, but that's what I recall.
I never understood how Sparta Dos could
bypass the MIO routines, unless the MIO
has user RAM that could patch the read
routines. (???) An analogy is the C64 1541
drive that has user RAM that can be
programmed to do things not in the ROM codes.

> Aside from the sio2pc, which in my opinion will be awesome, how can I get
>the 5.25" of my PC to write Atari diskettes.

I'll look on Pool Disk Too and see if there
isn't a utility to write Atari Disks on the PC
from images. If there is, then you should be
in business since the Happy will read D/D.
Another possibility is Imagic, a fine utility by Steven Tucker, but I don't
remember if it
will write to Atari disks. You might check at
http://www.nacs.net/~classics/
But longer term, get APE and an APE or
SIO2PC cable and save yourself a lot of
time and aggrevation. The only problem
with using a real Atari is who has room for
the 5 or 6 thousand disks it would require
to put all of the software on? (!)
A comprehensive list of the Emulator/APE
utilities/tools is needed, if someone hasn't already put one together. I'll
put that on my list...

```
The ChangMonger's sale/tradelist:
(email vchang@best.com or /msg ChgMonger on EFnet IRC to initiate a
sale or trade)

Updated 12/15-1998 - 5PM PST

The following applies to everything except PC items:
--------
All items loose unless otherwise noted

Prices that follow items are sale prices; those that don't may or may
not be priced later. In cases where more than one of a certain item
is
available, stated price is for ONE such item. All console (not
computer) games are as priced in the fifth (currently the latest)
edition of the Digital Press Guide (which may be ordered for $20 at
www.digitpress.com - a great buy and a must-have for collectors).
---------

Shipping is $3 for prioity mail within the U.S. and is NOT included in
prices listed
below. If desired, package can be sent via fourth-class mail (please
specify; default is whichever is cheaper)
I prefer trading rather than selling except in the case of the 2600
and
Vectrex carts, in which selling is preferred.

Minimum purchase charge is $7 (not including shipping) for sales.

Atari 2600:

Atari/Sears:
Centipede - $2
Crystal Castles - $4
Defender - $1
Demons to Diamonds -$3
Dig Dug - $1
Flag Capture - $4
Football - $1
Haunted House - $4
Home Run (x2) - $2 each
Joust - $1
Krull - $6
Maze Craze - $3
Slot Machine - $10
```

Space War - $5
Star Raiders (loose, with video touch pad... no overlay tho) - $3
Street Racer - $4
SwordQuest: Fireworld - $4
Video Olympics - $2

Activision:
Kaboom! - $3

Apollo:
Space Cavern - $6

CBS:
Blueprint - $7
Mountain King - $8

Coleco:
Donkey Kong - $2
Mouse Trap - $6
Venture - $5

Data Age:
Warplock - $8

Imagic:
Atlantis - $4
Star Voyager - $3

M Network:
Super Challenge Football - $3

Parker Bros:
Popeye - $3
Q*Bert - $3

Telesys:
Fast Food - $4 (loose board)
Ram It - $25

Atari 8bit:
Bug hunt - $4
Robotron (includes everything but the dual joystick holder) (x2) - $7

Atari 7800:
Centipede (Shrinkwrapped) - $1
Choplifter - $5
Dig Dug (Shrinkwrapped) - $1
Hat Trick - $1
Midnight Mutants (boxed) - $9
Realsports Baseball (Shrinkwrapped) - $1
Xevious - $1

Vectrex: (all loose)
Berzerk - $12
Cosmic Chasm - $12
Clean Sweep - $12

Handhelds:
Epoch:
Football tabletop (w' manual)
Other:
155-in-1 mini keychain game - $10

PC:
Battle Bugs (w' box/manual)
Hunter/Hunted (w' box/manual)
Monkey Island 2 (w' box/manual/codewheel)
Diablo (w' box/manual)
Lucasarts Classic Adventures (full package)

HARDWARE:

Atari-related hardware:
Competition pro joystick
Champ joystick (with retractable cord)
Suncom Starfighter joysticks (x2)

PC Hardware:
Gravis Gamepad Pro (complete package)

Wantlist: (including, but not limited to...)

Handhelds:
G&W:
Oil Panic
Green House

Atari 8bit:
(mostly rarer XE carts and third party carts, esp. synapse,
activision...(i.e. protector II, drelbs, pastfinder) inquire at will)

Atari 7800:
Commando
Ikari Warriors
Planet Smashers
Rampage
Xenophobe

Thanks to both Jeff and Steven! I'll keep a lookout for those docs. I
figure since I have the cartridge, might as well make a use for it. I
modified a old cartridge shell for the monkey wrench board to go in.
Now what is the "Machine language monitor"? That sounds interesting.

And "The Block"?

Hey, I was asking someone about this this earlier today, and maybe
someone has heard something about it. Back when the Atari service
center was located in Arlington, TX, my dad and I would do some dumpster
diving (stories of which are being featured in the A.U.N.T. newsletter)
but while we were there, we happened upon a cartridge box for the Atari
8-bit. When we opened the box up, it had manuals, and one cartridge...
however, the box looks like it could have held two cartridges.
The name of the cartridge (which I still have, though the roms were
replaced with e-proms long ago) was "EDUCATIONAL SYSTEM MASTER
CARTRIDGE"

I'm thinking this might have been a left and right setup... but at this
point I would like to know what someone REALLY knows about this
cartridge.

I still wanna know where I can get the ATR file for the 5200 version of
Star Raiders! (Rainbow emulator can play both 8-bit and 5200)..
hehehe...

Wasn't that POKE 54018,52 to switch it on and POKE 54018,60 to turn it off?
(don't forget to press PLAY and maybe turning the volume of you TV/Monitor a
bit lower wouldn't be a bad idea too. Somebody once gave me a tape to put some
files on. It still had some music on there. Man was that loud. It's a pitty
I couldn't have seen his face when he tried to load the games)

I thought i once read about an adapter or something that allowed the use
of a normal tape recorder to save/load data - this brings a question to
mind - Can a file stored on my PC be read w/ a pc program that converts
the data to sound pulses that can be fed to the sio port and read as a
cassette drive? (can APE or sio2pc do this?) There's a pgm that can do
that for a SuperCharger for the Atari 2600. You just plug the
supercharger into the speaker/line out of the sound card and run the
program.

As I said: Almost nobody had disk drive here. 8bit computers were terribly expensive (you know - we were living in communism). Because standard tape drives were so slow, one of the Atari Club CR (Czech Atari UG) members made hardware modification called TURBO2000. 2000 because of 2000 baud speed. It didn't use the blocks, so that it was very fast compared to standard mode (longest programs took maximally 4-5 minutes to load). It has many drawbacks - the programs should be linearized (no inits, no loading pictures etc.), lots of programs must be changed in order to work with it. There were also faster versions up to 9600 baud. But such speeds are almost impossible to load - too many load errors.

Generally it looked like Sinclair's loading - black and white stripes over the screen - but the Antic was turned off because of performance reasons.

Later (I've sold my Atari in 1991) they made B: handler, which was like disk drive. Except for random access. I have TTDOS as a EXE file, but it won't work without hardware modification - and I don't have the plans.

The adapter was published in an electronics hobby magazine (forget which
one) and was relatively complex (read expensive).

You probably could fiddle an audio interface but why bother? If you're
going to hook to the SIO port, you've already got the most expensive part
of Rick Cortese's 1489 design--the SIO cable. The chip and a diode can be
had for less than $2 and I'm talking Canadian bucks. You'd be much farther
ahead using SIO2PC or APE both for speed and from the aspect of having
proven, debugged and reliable software.

5093. Re: UNIX for 6502....

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-16 00:00:00 UTC
From: Christof Odenthal <Odenthal@AnySIM.de>
Message-ID: <3677F31B.1CF7@AnySIM.de>
Source record: 57411

hi,
Unix started long ago on computers which had no more than
64 k of memory (e.g. the PDP-11) and i doubt if anyone of
them had virtual memory or any protection.
There is currently a Linux clone in development for the
8086/8088 16 bit-CPU called "ELKS" and there are already
several Unix clones for the Commodore C64 (e.g. Lunix, look
at http://www.heilbronn.netsurf.de/~dallmann/c64.html). And
i have found the C sources of a Unix clone called UZI for
CP/M computers (Z80 + 8085 - CPU) - so why shouldn't it be
possible on the Atari ?! The Atari is even faster than the
C64 ! You only have to fiddle around with the stack and the
zero page.

And if you wish you can make a kind of 6502-emulator which runs
on your Atari (a 6502 emulating a 6502...) and which checks each
memory access of the program it emulates before permitting it -
so you can protect your tasks/processes. Using this method you
can even simulate virtual memory, e.g. through new mnemonics.
The disadvantage is the slow down of the execution speed.

If this is to slow for you then you could try this method: You
have to write a special C compiler which everybody has to use to
make programs for this Unix clone and which accesses memory only
through calls to a memory manager. The memory manager takes care
of the segment boundaries of the current task and stops each task
which wants to access a memory cell it doesn't own. Here the
disadvantage *may* be less protection against a crashing task.

By the way: I've heared that the C64 freaks are even planning to
make a TCP/IP connection and a WEB BROWSER !

bye,
Christof.

> SIO2PC software with the APE cable?

I believe Nick has 1 and 2 chip version of SIO2PC, and both types
of cables will work w/ APE, so yes. The one-chip max232 and the 1489
both work on the 1-chip setting.

The 2-chip setting is only required if you have an older cable w/
the additional tristate.

You can use the save binary option of DOS, or there were special
programs to make boot-load cassettes.

> 2) If the average Atari disk holds 90K-180K depending on
> format type.. then what would a cassette hold? Has
> anyone ever wondered the storage capasity of a 30
> minute tape? How about a 60, 90, or 120 minute tape?

Packed back to back with blocks, an Atari 30 minute tape would hold
about 135k of data. However, the standard cassette format uses a long
liead in tone, and long IRG's.

Given the log IRG and any extra time for dead space and more lead-ins
used by multiple saves, the capacity drops to around 75k or so, or less.

> 3) With that last question in mind, (and here is the kicker
> above all) could a primitive disk backup system be
> devised for the Atari cassette driver. :)

Sure, but your jumoing out of the frying pan and into the fire there. Tapes
are terribly unreliable, even when first saved.

>make a TCP/IP connection and a WEB BROWSER !
>
This is exactly what got me interested in my Atari again and dusted off my 130XE/1050! I figure that with the simplicity of memory-upgrading the XL/XE, and with the bank-switching capability... why can't we write the TCP/IP and Web Browser stuff...

Okay, okay... So we have the problem of not having a min. 640x480 display... But with the capability of 80columns' display, it should still be a possibility, and maybe some slick approach to a DLI routine that will handle the colors (if needed)...

Anyways, I'm still mulling over the details before I get serious about it and start toying around... but until then, I've been trying to obtain everything I can regarding the Atari and playing with the Atariwin800 emulator until I get the SIO2PC/APE interface and can start REALLY getting serious about my ol' buddy Atari system...

There *HAS* to be someone here that thinks it's possible to do and don't listen to the foggies who keep asking "Why bother when you already have it on the PC?!" To those people I can only say... you must never have *USED* your Atari... but rather must have *PLAYED* with it. I was and still am a *user* and not a *player*... even if I needed to dust it off recently...

The Atari is the most predominantly documented 8bit ever! And why not? It has the best userbase ever known in the computer industry, even when the company itself dropped us...

(Stepping off my soapbox once again...)

The XF551 is a double sided drive, but many of them were sold with DOS 2.5 which does not use the drive's full capacity (it's a long story, Atari was working on a new DOS, but they were forced to release the drive before the DOS was ready). The XF551 only uses the index hole when it formats disks. It can read or write flippy disks, but without modification it can't format the back side.

If I'm not mistaken, all you have to do is press Play. That poke turns
on the motor. The Atari cassette recorder was a "stereo" machine with data
on one track and sound on the other (it could record data, but not sound).

I think you've summed up things pretty nicely, Richard. I've got some discussions of alternate hardware in my web site and SIO2PC FAQ at www.cswnet.com/~nkennedy/

The 1489 and a companion chip (1488? 1490?) each convert TTL and RS-232 levels in one direction only. I think one requires a 5 volt supply (easy) and the other requires + and - 9 volt supplies (not so easy). I think these chips predated the MAX-232. When I found out about the MAX, I jumped on it--conversion of two lines in EACH direction, all with a single 5 volt supply. Yes, expensive at first, but now $1.65 or so from B.G. Micro.

Regards,

Nick Kennedy (the SIO2PC guy)

Hello everyone!

I have the following atari Compute's books left for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each plus shipping. I would suggest the 3 day shipping as it is only $3.00 and gets the books to you quickly at a reasonable price. Please e-mail me if you are interested in any of these. Thanks!!

Click Here:

http://members.ebay.com/aboutme/ebaked/

This is a 3 Day Auction ending on Sunday 12-20-98. Bidding starts at
$0.01 and there is no reserve price.

ADVENTURELAND SAGA #1
8 BIT ATARI/APPLE
(c)1982 Scott Adams - Adventure International

This game was released in 1982 by Adventure International for the Atari
400/800/1200 computers. The case also says Apple Disk, but there is only
one disk with a label on one side that says Atari Disk. The disk is
double sided, so the Apple version could be on the second side of the
disk. I'm guessing the Apple version is for the Apple IIc or IIe.

This is a Text Adventure Game with high-res graphics by Scott Adams.
This title is the first game in the "Adventure" Saga, which also
included these additional games:

Saga #1 Adventureland
Saga #2 Pirate Adventure
Saga #3 Mission Impossible
Saga #4 Voodoo Castle
Saga #5 The Count
Saga #6 Strange Odyssey
Saga #7 Mystery Fun House
Saga #8 Pyramid Of Doom
Saga #9 Ghost Town
Saga #10 Savage Island Part 1
Saga #11 Savage Island Part 2
Saga #12 Golden Voyage

This game is almost complete and includes: the original 5 1/4 floppy
disk, the instruction manual, and the plastic case (box). (The only
missing items are the warranty card and the original disk sleeve. A
Verbatim disk sleeve is included.)

I don't have an Atari computer or an Apple computer, and this disk is
untested.

CONDITION
{SW}=SHRINKWRAPPED {MT}=MINT
(EX)=EXCELLENT (VG)=VERY GOOD
[GD]=GOOD [FR]=FAIR
!PR!=POOR !JK!=JUNK

(EX) 5 1/4 FLOPPY DISK (EX)
A couple of very light scratches on the silver label. The "S.A.G.A. #1 ADVENTURELAND" label has a small amount of anti-plaquing.

(VG) INSTRUCTION MANUAL (VG)
Cover has a vertical bend along the left side about 1 cm. away from the spine. This was caused by closing the case with the manual in one of the grooves. Other than that, only minor wear.

(EX+) PLASTIC CASE (EX+)
Looks brand new. Has some light scratches in plastic cover. Inside is dent free and white.

Please email me before you bid if you have any questions.

Thank You,

Joe

Hmm... it is interesting how the Doctor and James Bond are similar in
the way that they can successfully interchange actors. The same goes
for Sheriock Holmes. The only difference is that ONLY Doctor Who can
pass off a totally different actor, wearing something completely
different, and maybe acting externally different, can STILL pass off the
new guy as the Doctor.
Try having James Bond wear something other than a nice suit or a tux.
Point made. :)

Let's see...

First Doctor: Peter Davison... my favorite for years.
First Bond: Roger Moore

While Piers Browsman (?) is quite good, Roger Moore is bond!

As for the Doctors.. after viewing all eight (nine including the cheezy
Dalek movies...) Jon Pertwee wins in dress, charm, wit, gadgetry,
vehicles, singing, venusian akido moves....
... truly the bond of Doctors!

Doctor Clu

* * *

That is too cool! I was talking to someone earlier today who was sure
that the 300 buad barrier had never been broken! (Hmmm.. the Coleco
Adam had a "High Speed Cassette Drive" .. wonder what speed that went
at?)
Alright, for my vintage computing I need to get one of these Turbo
2000's running (I've got an extra 1010 recorder that was basically given
to me.. what the hell!?) How can I contact the Czech Atari user
group?

To quote Peter Loury "Hehe.. now I've seen everything..."

Well, the good news is, I managed to get the programs on the cassette
that I was after for the upcoming Atari meeting this weekend. (Christmas
music) and turns out they were basic programs all along. What can I
say? It's been a decade since I cared to look at them. :)

(And the other irony is, I'll probably take my hippo 800 with a DISK
DRIVE anyway to show off the latest edition of the Ol'Hackers Newsletter
disk.. which if you don't get it.. do! (Just talk to Alan Shakins)

Excuse me, but Sean Conners (spelling?) was the 1st actor to play
"James Bond". But do not forget "In Her Majesty's Secret Service"
which was sort of a prequel to the bond movies but technically was not
one of them. Or so I remember barely.

Oh dear we're all getting a bit confused.

I think you'll find Jon didn't mean Roger Moore was the first Bond, he meant
he was the first he saw. Of course Sean Connery was the first Bond and (IMO)
the best but Timothy Dalton did a very good job.

It's "Pierce Brosnan" BTW and I utterly detest Roger Moore's Bond.

"On Her Majesty's Secret Service" was George Lazenby and it was one of the
first movies I ever saw, certainly the first Bond, so I always had a bit of a
soft spot for it. It was a "serious" Bond movie not seen again until
GoldenEye (to semi-quote the reviewer on IMDB -- but I agree anyway).

As for the Doctor, has to be Jon Pertwee -- the Action Doctor :-) though
my first Doctor was William Hartnell.

Don't quote me on this since I don't have any proof. But I have asked the right cart slot question to many people over the years (including some ex-Atari people) and on more than one occasion I heard mention of being able to program eproms or carts or whatever out of the right slot. How exactly to do this, I have no idea. Nor do I remember who told me that. I assume it was something done internally with special hardware, etc.

I've been wondering that myself... One way to find out would be to write it on the emulator, huh? Then test it on the hardware (real) system to verify its compatibility... Hmmm...

In the meantime, I'll continue working the ideas out on paper regarding the necessary display for web browsing... Already have some strong leads worked out.

5117. Pinout for Basic ROM?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-17 00:00:00 UTC
From: Olav Queseth <Olav.Queseth@radio.kth.se>
Message-ID: <3678FBE0.CE82FF62@radio.kth.se>
Source record: 57298

Hello!

Does anyone know the pinout for the strange 24-pin 8Kbyte
ROM that atari used for the Basic interprester in the
XL/XE series.

I fried my ROM some time ago and I'd like to replace it.
Simply buying a new one is no fun :-).

/Olav

In the sacred domain of comp.sys.sinclair didst Doctor Clu <clu-da-bard@geocities.com>
eloquently scribe:
: First Doctor: Peter Davison... my favorite for years.
: First Bond: Roger Moore

: While Piers Browsman (?) is quite good, Roger Moore is bond!

Rubbish! Sean Connery IS bond.
And John Pertwee IS the Doctor... Or rather was, seeing as he died a while
back.

I suppose you only remember him for Wurzle.

: As for the Doctors.. after viewing all eight (nine including the cheezy
: Dalek movies...) Jon Pertwee wins in dress, charm, wit, gadgetry,
: vehicles, singing, venusian akido moves....
: ... truly the bond of Doctors!

Exactly.

Although I quite like Patrick Troughton.
He was a bit of a clown, but he could also pull it off, unlike Sylvester
McCoys early episodes.

oops you're right, it is 52.

There was also a few other turbo cassette upgrades, at least here in the UK. I think Micro Discount used to sell one. It involved a modification to the tape deck and some special software as I remember it. Some commercial software was even modified to load from this upgrade.

Also if you want to load a program and hear music at the same time (as asked elsewhere), then you need to save the music on one track, and the program on the other (Atari cassette decks are stereo), then just CLOAD or boot the tape normally, and turn the sound up. I can't remember which track is which now, but I *think* the outer track is audio and the inner track is the data track.

> available for it.

Aha <dons know-all hat>

Dr No was the first of what is regarded as the 'real' James Bond (made
in 1962) , played by Sean Connery (From Russia, With Love, Goldfinger,
Thunderball, You Only Live Twice, Lazenby took over (On Her Majesty's
Secret Service) then Sean Connery took over again (Diamonds Are Forever)
and then was replaced by Roger Moore, then Sean did 'Never say Never' an
'independant' James Bond based on Thunderball, then Dalton and finally
Brosnan.
So Sean Connery was the first, third and fifth James Bond. There are
moves for a new Sean Connery Bond movie with 007 coming out of
retirement to save the world so he could be the 1st, 3rd, 5th and 8th
James Bond.

There were two other James Bond movies made:- Casino Royale (in 1967)
where David Niven played James Bond in a spoof and an American James
Bond movie (made in 1954) also called Casino Royale. It was an NBC
television movie with Barry Something-or-other playing Bond.

But how about this for a real Gobsmacker? The first person ever to play
James Bond was none other than a young Bob Holness (Blockbusters, gimmie
a 'P' please Bob!) in a radio play. It emerged in an interview with Bob
a couple of years ago.

Source record: 57305

Hi,
there is a already working TCP/IP-stack for CP/M computers - so
why shouldn't it be possible on an Atari ?

To connect your Atari to your internet provider you will need a
data transfer protocol for the modem line. The most commonly
used protocols are SLIP and PPP. SLIP is the predecessor of PPP
and is somewhat easier to implement but today most of the
providers use PPP which isn't backward compatible, i think.

I think it would be best to offer a "Atari-UX" (like HP-UX)
together with a web browser both as cartdidge and as program on
disk. So the beginner can try the disk based version while the
experienced or professional user can use the cartridge for faster
access (the cartridge could e.g. have battery backed RAM).

bye,
Christof.

Why didn't anybody ever think of the idea to install a switch in that thing. I wouldn't know which lines to switch, but it shouldn't be too hard. BTW that would also be a good idea for these Plug and Jank carts that have been comming out lately. (for those who are new to this group: In the last halve year, software that never was on cartridge (and never was intended to be) has been released on cartridge. You plug them in, boot the computer and then jank them out while the computer is running. Bad idea is you ask me.)

Why not use a small flash ROM thingy inside for the preferences?

> Instead of using a mouse, we will use the second strong point of the
>Atari... a JOYSTICK! (Complete with clickable fire button) :)

ST mice work on 8 bit ATARI's (needs just one resistor to make the right mouse
button work), so do AMIGA mice. With the proper software ofcourse. You guys
could make a menu, where the user could choose between ST mouse, Amiga Mouse,
Joystick or maybe even Touch tablet or light pen.

>

This is more than feasible, especially if we could obtain the technique used
in the bank-switching carts so that we can enhance the browser's
capabilities beyond the 16K or so standard cartridge. Someone mentioned a
cart can support 256K. Great, but we need the bankswitching technique to
utilize it because of the way the Atari handles RAM.

> The way I figure it as a sketchy outline, devise the browser so that

>maybe someone could mention if JPEG and other have been done as well.
>

Let's take this one a step further, Doctor Clu!

A customized DL could accomodate a menuing system that most people using a PC could be comfortable with, and a browser area for the display of the web pages, too.

Now, let's discuss the HSCROL/VSCROL capability of the Atari. You can go either coarse or fine scroll with this excellent ANTIC feature. Anyone that has played Eastern Front may know where I'm going with this proposal:

Why not utilize this capability of the Atari 8bit for an optional display mode that PC users would compare to the new Win98 feature called multi-monitor display... except we Atari owners wouldn't need multiple monitors to use it. Instead, a 2x2 display would simulate a closer representation of a web page as an option, and the user could scroll using a joystick plugged in Port 2 (or the arrow-control keys otherwise) to get the whole page as necessary. Because the browser would be handled via cartridge, the shift in display should be rather quick, don't you think... like changing graphics mode because you'll be loading a new Display List for the ANTIC chip.

The icon suggestion for pix not loaded could be taken a step further by having a box of the specific size shown on the screen where the pix would appear... BUT, if we emulate a 640x480 display using the 2x2 screen display, why not simply load the pix? Unless we can go 256 colors, though, the pix could look rather poor, but they'd be there nonetheless. A custom DLI routine might better emulate 256 colors?

> Instead of using a mouse, we will use the second strong point of the
>Atari... a JOYSTICK! (Complete with clickable fire button) :)

Or we can do this:
Port 1: mouse/joystick (selective setting via user) -- clicking links --
Port 2: mouse/joystick (selective setting via user) -- scroll multiscreen display --

>
> How's this for an early sketch?
>

To summarize:

Web Page browser scenario
1) Cartridge-based in Professional user form / Disk-based in
evaluation/freeware form
2) 80-col in standard display
3) Scrollable 2x2 screen display in enhanced display
4) Menus
5) Custom DLI routine for increased colors
6) Ability to handle graphics in enhanced display with internal
(cartridge-only) routines for GIF/JPG pix
7) Use either mouse or joystick

we are the ones who are producing this line of carts,and at least we
tried something that no one else was willing to do,something new for the
atari,they sell well,and after a little fooling around most people get
used to it and it works just fine,we have sold hundreds of these
carts,with very little complaints,we have currently 23 titles out,and
only a few are the pull types,everything else runs from the port,but we
think that we have found a way around the pull,and if it works out,we
will be replacing these with the new type asap,thanks,
lance

Hey gang,

I found my MWII Users Guide. The bad news is that I currently don't have access to scanning/OCR. I noticed a kind soul mention he'd try to scan his, is that in the works? If not, I can photocopy mine and send it to you.

Quick Summary:

18 new commands for use in BASIC. All must be prefaced with a ">" symbol.

```
>A x y
automatic line numbering beginning at x at increment y
>E
MWII lets you use the cursor keys without CTRL (CTRL lets you get +, -, =, an
*). This command switches it back to normal.
>D x y
delete lines x through y (may cause lockup)
>U
Upper case lock (overrides CAPS LOWR)
>#  x
converts x from dec to hex
>$ x
converts x from hex to dec
>T x y
memory test, hex addr x to hex addr y
>R x y
renumbers from line x, increment y
>F /string/ x y
find string between lines x and y (/ is a delimiter that can be any character, %
is a wildcard)
>X /searchstring/replacestring/ x y
exchange searchstring with replacestring between lines x and y
>M x y
set left margin to x and right margin to y
>SE
scroll enable: scroll using START and SELECT keys
>L x y
>LP x y
formatted list of line x to y, to screen or printer
>V
>VP
variables and their current values, screen or priner
>>x
directory of drive x
>CO x y z
```

copies lines x through y to z

enter the ml monitor

There's a bunch more commands available in the ml monitor that I'm not up to typing in right now. Hopefully, this gives enough to play with until the pdf manual gets posted somewhere.

Have fun,
Jeff

What he means is Roger Moore was the first person he saw playing Bond.
Peter Davison was certainly not the first doctor either!

I am selling a 65XE game system with the following components included.

* 65XE System w/detachable keyboard
* Power Supply
* RF Cable (No Switch box,sorry)
* Light Gun
* 1 Joystick (Grey in color to match the system, not the black ones)
* 4 Cartridges:
* Barnyard Blaster (Requires Light Gun)
* Bug Hunt (Requires Light Gun)
* Flight Simulator II
* Fight Night (Boxing)

I am asking $60 + Shipping, but will take reasonable offers too.......

If you have any questions, feel free to E-Mail me.

Thanks,
Bill......

Exactly! Those were the first of those two categories that I saw. Not to say that they were the first to play the role, just the first I saw. Roger Moore is still bond all and all.

As for Peter Davison of the Doctors.. he captured the gentleman side of the Doctor best which was quite inspiring. All and all, his episodes were probably the best overal blend of music, special effects, story wrting... perhaps the peak (built off Tom Baker's momentum).
Contrast that to Jon Pertwee... bad writing, bad music, bad props, bad chase scenes, terrible costumes.... only Roger Delgato (The Master), and Jon Pertwee (The Doctor) could save the show... so you have those two keeping it interesting, plus you have a lot of b-rate stuff in the background for a good laugh.
And yes, some of my best sleep happened while watching some Jon Pertwee adventures. I laughed hard, got some good wit from Pertee, and some good sleep. I could never have been healthier! :) What more could a person want?

Sean Connery's claim to fame as Bond is being able to best say:

"Bond.. James Bond."

And while Roger Moore says that line second best in my book, I always thought Moore had more a fun flair as Bond.

As for Troughton... couldn't agree more. He played the clown, and he played it well. He could completely pass himself off as a baffoon and evil villians would believe.
McCoy would pass himself off as a baffoon, and his villians and companions would believe it. Hehehe...

I think it's interesting that Troughton would be the only Doctor to appear THREE times after his term as the Doctor (Three Doctors, Five Doctors, Two Doctors) Praise be to Colin Baker for bringing him back that one last time. :)

> 6) Ability to handle graphics in enhanced display with internal
> (cartridge-only) routines for GIF/JPG pix

Beautiful!! First off, let me mention how cool it is that once again we have hit on one of the 8-bit strengths, which is graphics and the ANTIC chip. With that ability, scrolling would be more fluid. (And yes, I have played Eastern front... might be buying it again soon...).

Alright, I like the list we have there, now let's break this down a little further.

1) Cartridge based form. Since I suggested it you know I support it. Two people have mentioned the idea of using a 256K bankswitchable cartridge. How common ARE those these days? Is it a possibility or reality? I know for sure that 64K bankswitchable cartridges (Like the "Six Pack") exist. But 256K?

If this does exist, we would have to allocate them to 8K blocks, or is a 16K block possible? (Still learning..hehe...)
I'm kinda curious how much space we have to work with and what we would like to have go where. It looks like this web browser, like many web browsers, will be made in pieces. Of course, at this point I am putting the pieces together and creating a spread sheet.

2) 80 column display... should we rely on the fact that people have Omniview, Austin 80's, and XEP80's... or... create a routine somewhere in the program to make this happen?
For simplicity, I would suggest to include it if space is available. But 80 columns is a must for browsing.

3) Scrollable display... again, love it! How much do we know about the ANTIC to tap this?

4) Menus? What ideas do we have at this point? I like to shy away from what the Mac and PC do best... they obviously have the windows idea down pat, and we know that takes TONS of memory.. or at least more than a 8-bit can afford. I would like love to approach this from a new and simplistic angle. (Something that uses only 8K.. hehe..)
Just kidding...

5) "Custom DLI routine for increased colors"... I'm sorry, "DLI"?

6) " Ability to handle graphics in enhanced display with internal
> (cartridge-only) routines for GIF/JPG pix"

Cool! Yeh, I guess that does bring up a good point... what picture viewers could we use to help make this possible? Back when I was using Atari (about 1985-1986) there was a program called "Lantern" to read gif

files. I'd like to think there have been better programs since. I figure rather than re-invent the wheel, I wonder what programs have been written, and if the programmers could be contacted to either help with the code, or allow us to use the code. (We'll try the proper approach first.) :)

7) " 7) Use either mouse or joystick"

Joystick was the universal controller of Atari, I say at least that. (Space being considered again until we know exactly WHAT space we have to work with) After that, the Koala pad, mouse, light pens, hell... a XE light gun (grin) could be considered as alternate possibilities.

Now speaking of pieces, don't tell me that SOMEONE hasn't already tried to write a PPP or TCP program for the Atari already. Again, before re-inventing the wheel... has someone else started on this?

This is cool...

Well, as I understand a cartridge, it's a one direction thing. The cartridge is read by the computer for the contents of the ROM. There is not much handshaking that goes on the other way. I would love to be corrected if this is not true.

Anyway off the hand I would have to say I agree with you on the modified hardware theory.

>Larry

There is a difference though. The C64s drive had its own processor, much like the 1050 does. The MIO just uses the 6502 in the Atari. And as the MIO (mostly) behaves within the structure of the Atari OS, you can also usurp it's interrupt handlers and the like. That's how the HyperSpeed driver for the MIO works. The existing mechanism for Parallel port device interrupt handlers isn't particularly fast... so the Hyperspeed replaces it.

Except for David Niven who played James Bond in the first Bond film (and
of course Woody Allen who payed his nephew, Jimmy Bond...), how quickly
people forget... ;-)

I own 19 Ataris (8 of them are hooked up and ready to run at the moment). I'm sure I have tapes lying around somewhere, but I normally run my software directly from the harddisk of an HP 386 PC using Steven Tucker's APE program.

Why do you ask?

Jeff

If it would help, I wrote a Sparta .com file to run ABASIC (on my 1088XE I need a switch to get at the ROM and it's just not worth it).

Essentially, what it does is copy the ABASIC code into RAM and run it from there. If you want the file let me know. I emphasize: SpartaDOS only.

Ya know, it took about a week of this thread before I understood you
were talking about Doctor Who...

However - *Roger Moore* as the first James Bond?

You must be *really* young. I don't suppose you knew that Paul McCartney
was in a band before Wings, do you?

Tom Baker is my favourite Doctor, too, but I have observed (generally,
not always) that ones favourite tends to be the one you saw first - this
seems to apply to James Bond, too.

Since it was mentioned, however, I'd much rather watch a good episode of
Blakes 7 - Paul Darrow/Avon is brilliant!

Data is output by the Atari as audio. Any cassette recorder can
record it as normal audio. When the Atari reads data from the tape,
it expects binary data, so no sound at all. Converting the FSK
sounds on the tape to digital serial data is done by a circuit in
the cassette unit. There was a cassette interface called TIC
or something like that, which is simply a converter from FSK to
digital data. It is a small metal box that connects to the SIO bus
and the audio in and outputs of a regular cassette recorder.
Recording required no interface at all, except
connecting the recording input to the audio out on the SIO bus.
APE can be used to load cassette files. Cassette files can be
created by the WAV2CAS program which I wrote. You must
create a wav file with a sound card and a recording program.
The program then extracts the data. You can find the WAV2CAS
program in the Umich archives. It also contains everything
technical there is to know in the documentation.
Keep those XL's/XE's humming.
Ernest.

: I just purchased an Atari 600 in box for $10. And for the life of me, I
: can't figure out how to get this thing set up. Apparently everything was
: included except for the set-up manual. Please help!

Four items are needed to set up this machine to work with a TV set: the 600XL computer console, a power supply, an RF cable, and a TV switch box. Connect the RF cable between the computer and TV switch box RCA sockets. If the RF cord has a square or round piece about 6 inches from one end, plug that end into the computer. Connect the TV switch box to the 300 Ohm VHF terminals of the TV set or add a 300 to 75 Ohm adapter and hook to the TV's 75 Ohm input. Plug the round power supply plug with 7 pins into the back of the computer and connect the AC plug to a wall socket. With the TV on and tuned to channel 2 or 3 set the computer channel switch to the same channel. Turn on the computer. The normal screen should be blue with the BASIC READY prompt in white letters. Powering up the computer with the OPTION key pressed or typing BUE [Return] in BASIC should start a self-test mode. A stock 600XL has 16K or RAM.

i looked into this a few years back, and basically the difference between the two slots is the left one can access two 8k banks and the right one can access the second bank of the left slot, the reason you only see left carts is 16k roms became cheaper, so the right one was not used..... as for carts for the right slot.... all i know of were the mw, mwII, r-time8, and a learning system had both carts.... the right one was same for all the 'class's' the left one was changed for each..... you can put two 8k carts in at once.... (use basic and assem/editor) both are in memory you can peek the mem locations.... there are vectors to run the carts the right cart gets inited first if none goes to left cart (with assem and basic cart they both tell the machine to init left cart so basic (if in left) gets run..... i played around with it (i was doing some programming and needed to get some routines moved) if the routines are relocatable the cart can go in either slot but i wouldnt know how to init the cart easily...

> the colors (if needed)...

I'm totally with you on this one, and while I understnad the early part
of logging on and the html code... which the Atari could EASILY handle,
what is required for TCP/IP connection?
Could someone please explain this part of the process for me!!!

All and all, I think the Atari GREATEST strength is cartridges.
It's just an idea, but if we could make some part of the webbrowser in
cartridge form we will have one screaming fast loading browser! It will
be simple, but it will be fast.

The way I figure it as a sketchy outline, devise the browser so that
the bulk of the base for the browser, the non-changing part, is in the
cartridge. You slap it in, turn it on, boom! Instantly it's loaded.
The cartridge based program then looks to the disk drive for preferences
(yes I'm a Mac user.. hehe..) that it gleams here and there, which would
be short bursts of information quickly loaded off the disk. If these
are not found, the cartridge based browser then asks for preferences
from the user, at which time a preference disk can be created.

The actual browser part of the program would be quite simple. It would
be similar to a regular browser with the automatic picture loading menu
turned off. Similar to that, a icon could be made to represent a
unloaded picture. I know that Atari's had programs to load GIF images,
maybe someone could mention if JPEG and other have been done as well.

Instead of using a mouse, we will use the second strong point of the
Atari... a JOYSTICK! (Complete with clickable fire button) :)

How's this for an early sketch?

Doctor Clu

> --
> Ron
> rlaski@midwest.net

You know, I might have a disk version of that, but I'm not sure. It would read the left hand slot, and you have had to hold down the door button to allow the computer to power on. Then once you had the program up you slap the cartridge in the left slot and hope the computer didn't crash. If it didn't, you were in business. :)

Ah well.. one old pirate technique. I was novice pirate in the good old days. Yeh, they did get touchy back then. That's one thing we remarked about at the last A.U.N.T. meeting was how laid back and cool about a lot of things we are these days compared to ten years ago. For example...

Then (10-15 years ago...)
Someone talked trash about the Atari, you'd beat them up.

Now
Someone talks trash about the Atari, you laugh and say that you were looking for a windows alternative.

Then
Commodore was the enemy.. the Anti-Atari!!

Now
We peak over each others shoulders for upgrade ideas, since they are going against the grade as much as we are.

I'm sure we could think of a few THEN/NOW examples.. but I know what you mean. :)

> sloopy.
>

Hey, I tried that trick.. basic and assembler... came up just fine...
maybe someday I'll learn how to access assembler from that setup. I've
also learned that Star Raiders and Monkey Wrench works fine... :)
(At least Star Raiders successfully ignores Monkey Wrench..)

Hmmm learning system had both carts eh? Could you be referring to the
"Educational System" by chance? Cool... if this is the case, Atari
might have very well produced a "RIGHT CARTRIDGE" case!

Alright, one thing that has me wondering and I just have to ask to get
this over with... the cartridge slots are only read and never written
to, right?

(Just thinking it would be cool if you could take a disk based program,
and have it copy all contents of a cartridge on the left over to a blank
E-prom cartridge on the right. A poor man's E-prom burner and cartridge
writer.)

Ah fiction is a nice thing...

From "Mapping the Atari" revised edition page 131:

54018 D301 PACTL
(W/R) Port A controller. POKE with 60 ($3C) to turn the cassette motor
off, POKE with 52 to turn it on. You can put a music cassette in your
program recorder, press PLAY and then POKE 54018,52. Your music will
play through the TV speaker or external amplifer while you work at the
Atari. You can use this technique to add voice tracks to your programs.
To turn off the music or voice, type POKE 54018,60.

My 2c: (I've talked about 8-bit web browsing a lot here, so I'll keep it short)

We should look closely at how WebTV does everything. (Hah! A WebTV commercial is coming on rigt now, what a coincidence!)

Although, at this point, it might be easier for Atari users to all buy $99 WebTV units than to try to code something! ;)

-bill!

5177. TCP/IP - why? Why not just PPP?

Date: 1998-12-18 00:00:00 UTC
From: nbs@sonic.net
Message-ID: <75cod8$v3i$2@ultra.sonic.net>
Source record: 57242

I bet I'm missing something important here, but do we NEED TCP/IP capabilities just to do web browsing on an Atari? Can't the web browser have built-in PPP code? Or is TCP/IP just needed, period?

(Of course, we can do it with a proprietary proxy-type program running on a Unix shell, which is my suggestion, since so many people have it and it'd be hecka easy to code :))

In the sacred domain of comp.sys.sinclair didst Tom Lake <tomlake@slic.com> eloquently scribe:
: Hint #2: The year was 1954
: Hint #3: The movie was Casino Royale
: Hint #4: It was NOT the version of Casino Royale with Peter Sellers and
: David Niven

: The first one who can answer this gets an official "attaboy"

Bob "I'll have a 'P' please" Holness.
And it was a radio production that predated even 1954, I believe.

Here's a couple of alternate ways of locating them:

1) Check out the Hamfests during the summer months. They are a wonderful way of locating old computer items...cheaply. This is how I bought stacks of Antic and Analog at $1 per bundle.

2) Check local libraries. Preferably suburban ones. Many have annual or semi-annual book sales. Most of these books/magazines are donated by the public throughout the year. Ask to get in contact with those responsible for sorting through the stuff.

3) Ask at thrift stores such as Goodswill, Volunteers of America or Salivation Army. Unless you're really lucky, you'll probably won't be too successful. The lowlifes that run them either pocket the good stuff for themselves or throw 'em away...even after you make a request!

I knew it was you. But somebody recently told me it was rude to name names in this group so I try to prevent it.

(way around the pull)

Great. I didn't really like the idea of pulling it.

I may be a bit "aggresive" (not the right word, but I can't think of another right now.) about this because I've been dreaming of a MyDOS X cartridge for years. Than you brought out the MyDOS cart, and it didn't (atleast in my point of view) add anything new (enough to spend my money on it.). Sorry. I just hope someday someone developes a MyDOS X cartridge (bankswitching and everything, time and date, more then 64 files per directory, D10: to D15: support (for us harddisk users), larger than 16MB partition support, to name but a few.....)

Your doing a great job. Keep it up!!!

> For simplicity, I would suggest to include it if space is
> available. But 80 columns is a must for browsing.

In 128 or 256kB there should be room for both.

> Joystick was the universal controller of Atari, I say at least that.
>(Space being considered again until we know exactly WHAT space we have
>to work with) After that, the Koala pad, mouse, light pens, hell... a
>XE light gun (grin) could be considered as alternate possibilities.

ANG software developed a way to use an ST mouse and make it fast to on
the ATARI 8 bit. They used a table to compare the mouse signals to the
previous signals. They wrote an aricle about it. Maybe I can still find it.

Howdy Vlad

(hey, somebody from Russia??? I guess your the first one.)

I use PC's for internet and unpacking files I got via the internet. The rest I do on XE's. I have 5 of them. I do have cassettes, but 20 minutes to load a game like AirWolf (not worth the time or money) is a bit to much. So now I boot of a SCSI HD. If I don't install a RAMdisk, it takes 4 seconds to boot. With a RAMdisk it might take 10 seconds. (try THAT on a PC)

From: Doug Wheeler <dwheeler@isd.net>
Message-ID: <75dsod$ec1$1@blackice.winternet.com>
Source record: 57260

William Kendrick wrote in message <75cod8$v3i$2@ultra.sonic.net>...
>I bet I'm missing something important here, but do we NEED TCP/IP
capabilities
>just to do web browsing on an Atari? Can't the web browser have built-in
>PPP code? Or is TCP/IP just needed, period?

Unfortunately, you need to do it all. The internet protocols are arranged
(logically) in a "stack", which looks roughly (simplified) like this:

[Web browser] (not part of the stack)
[HTTP] (add-on to the standard stack)

[TCP] & [UDP]
[IP]
[PPP], [SLIP], [Ethernet], etc.

[phone line]

So, at a minimum, to support a web browser, you must implement PPP, IP, TCP,
and HTTP (along with some other, simpler protocols, like UDP and SNMP. You
might also want FTP and SMTP (for mailto: links).

Well, it's a start. As a matter of fact, it's more than a start (as
anyone who's been following the thread can say.) I'm not that
technically inclined, but I can wish you guys all the luck you'll need
and hope that you get some measure of success!

Project: PHOENIX
Atari 8Bit Web Browser

The trickiest portion of this whole thing for me as the programmer will be the handler for the PPP connection. I'm gathering what info I can regarding this, but if anyone knows of a routine that has been written for a 6502 microprocessor system or has the source code for it, I'd love to be able to look at it. I can write the rest of the browser software myself (obtaining a copy of Mapping the Atari, revised edition, which includes the XL/XE series, would expedite the development!), as I've laid out in the messages I have posted between Doctor Clu and myself and several other individuals who have donated their thoughts and brainstorms.

At this time, I'm looking at a (64K block) program size, but there are still many unknowns. The design will almost inevitably require a 64K machine, but I'm wrestling with the probability that it will require a 128K machine instead.

Compatibility with the Atari 800 and XL/XE series is my goal. Someone wondered if it will operate under an emulator... I run Atari800win myself when on the PC, but I have a 130XE computer sitting beside that which will be connected to the PC by the end of the weekend via an Ape-1489 cable. I have to thank Steven J. Tucker for his wonderful help in pointing me in certain directions regarding the APE interface and his software.

Will the "Project: Phoenix" software run on the emulator? By design, I'm not sure; the emulator can only do so much. "Project: Phoenix" will utilize the 850 interface and require at least a 14.4k modem, since most ISPs require such to connect. Besides, who wants to browse the Web at 300/1200/2400 baud? An emulator will need to address this R: requirement if it's to be used.

My goal is to first create the browser capable of the features I've mentioned in other postings. It is my firm conviction that the Atari 8bit can support it. To what degree I shall soon find out as I begin the project.

Some may ask why. To those individuals I can only say this: I have always had a special place in my heart for the Atari 8bit computer. Since the day I turned from the Atari to a PC, I have not programmed a single bit of code because it was all done for me. I got lazy. Now, with Atarians around the world finding one another and rekindling that warmth we feel in our hearts as we talk of our Atari, and I discover the wealth of accumulated knowledge that people are posting across the Web, I would like to personally give BACK to the Atari community a little something from me. To be able to boot one's Atari, designed by a company that has long since abandoned us who so undyingly supported it, and surf the Web in a time when the 'Net seems to be the future of computing and communication... is my reason. It's my humble

opinion that other Atarians will agree that this alone is a worthwhile reason. We as Atari owners who so vehemently supported a machine that the rest of the world (even the Atari company ITSELF) mocked and turned its back on can once again smile and be assured that our faith and fidelity to the Atari 8bit was not misplaced...

And if that is not reason enough... then here is another:

Because I can!!

(Stepping off my soap box once more...)

The cartridge ports are in the memory map just like everything else on a
6502 based system. They even have control line that is decoded just like
the PIA at $D300 for instance. The only thing that is missing is an IRQ
line which can be a fatal problem for adding things to the cartridge
port.
IMO: The only problem with a right cart eprom burner is you would have
to limit the left cart you would be copying to 8k w/o getting the design
a bit more complicated.
I used to use a Proburner<it went south> & AFAIK, it was at the right
cart address space.

In my original reply I was trying to remember if the Pro-burner was an option. Has anyone tried to plug one into the right slot on an 800? I sold mine a while ago so I can't try it. Anyone have one they want to test in their 800?

John

5203. Re: Atari joystic to PC interface (how?)

Message-ID: <367c7575.2237101@News.CIS.DFN.DE>
Source record: 57268
Cross-posted to: comp.emulators.cbm,comp.sys.atari.8bit

The other day "Jacek Bogucki" <gucek@transprojekt.krakow.pl> drivelt:

>How to connect? I would appreciate pin-to-pin picture, or any help.
>If you can help - please send me an e-mail or ICQ message, too.

You'll find a description at
http://www.hut.fi/Misc/Electronics/pc/interface.html. But you need a
little bit more than just a pin to pin connection.

5204. ANNOUNCE: Atari800win 2.5a & source released

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-18 00:00:00 UTC
From: rich@cstone.net
Message-ID: <pgpmoose.199812181917.32299@bureau42.ml.org>
Source record: 57269
Cross-posted to: comp.sys.atari.8bit,comp.emulators.announce

Atari800Win has been updated to version 2.5a, and the source code
archive has been updated as well. The Atari800win page is located at

http://www.cris.com/~Twist/atari800win

and the emulator itself is contained in this zip:
http://www.cris.com/~Twist/atari800win/atari800win_2.5a.zip

source code is in this archive:

http://www.cris.com/~Twist/atari800win/atari800win_2.5a_source.zip

Please do not download the source unless you intend to really look at
it; my bandwidth is very limited.

Here is what's new in this release:

12-18-98 Ver 2.5a
* Note: Older saved states will need to be re-saved for this
version.
* Re-synced with the general Atari800 code base. Fixed a couple of
Antic problems.
* Fixed screen getting offset when switching hardware types.
* Fixed the damn keyboard joystick not being detected (was only
happening on machines that have no hardware joystick devices, and
guess what - all of mine do. Grrr).
* Joystick selections are saved permanently. If you change your
stick config around (hardware wise), it won't crash, but you will
probably have to reconfigure via the joystick selection dialog.
* The scanline modes are now driven by highly tweaked assembly,
mostly because I changed the way they worked: they now show
half-lumen lines interleaved instead of black ones. In a couple of
the available graphics modes (GDI) even though a lot more work is
being done it's slightly faster than the older scanline mode.
* Added keyboard accelerators for the following functions:
Alt-C Cartridge dialog
Alt-D Disk dialog (floppies)
Alt-G Graphics dialog (screen modes)
Alt-H Hardware dialog
Alt-J Joystick dialog
Alt-K Keyboard dialog
Alt-L Load Atari executable
Alt-S Sound dialog
Alt-R Rotate through artifacting modes (including off)
* Last path used to load Atari executables is remembered

* Some small code re-orgs (same functionality, but less code)
* Fixed screen corruption in stretched-window modes when paused
* Smarter about registry updates - doesn't have to reset ROM paths
when these occur now. Also, for first time users tries to find the
ROMS in either the working directory or "ROMS" subdirectory
* Added different machine types in hardware selector for 320XE Compy
and 320XE Rambo

5205. Re: Atari 8bit Web Browser

Source record: 57270

AWESOME!!! When you make the browser are you going to have it in GTIA graphics mode? That'll prolly take a gangload of memory but at least you would have the most colors.

Or, you could have it depending on the size of the page or resolution of the picture to have it switch between appropriate graphics modes. Hell, I remember there used to be a trick to get all the colors of graphics 3 for graphics 8 by a lot of hex editing commands.

This has to be possible because the Internet was original designed when the Atari 8-Bit was considered the top of the line. I mean hell, the was CompuServe and GEnie also.

5206. 33.6 Modem for Atari 8-Bit!

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-18 00:00:00 UTC
From: Anthony Baker <antbaker@arn.net>
Message-ID: <367AACC5.433D9B6F@arn.net>
Source record: 57271

I have two modems, one is an external 33.6 SupraExpress Mac modem that I don't use anymore and another one is a 33.6 US Robotics Internal Modem for Wintels.

I was wondering, Is there a way I could get the 33.6 external modem hooked up to the Atari? Or better yet, is there a way I could take out the stuff out of my 1200 BPS Atari modem and put the internal in there w/ special hookups to connect to the part that normally hooks in the PCI card slot and have an adaptor on the other end for RS232?

Ermm...I just realized how unpractical and hard the above statement would be. What about the Mac modem?

Also, is anyone selling a SIO2PC cable that I can buy?

Laters,

antbaker@arn.net

I have a mint condition CSS BlackBox w/power supply and docs for sale or
trade.

I'm interested in the following trade items:

1024k MIO + ?
Super upgraded 800 (memory, video upgrades)
Syquest 135/230 SCSI removable configured for Atari 8bit
Transkey keyboard + ?
other items..

Umm, you'll also need to do ICMP - internet Control Message protocol. I've looked at this before. Yes, it's possible. TCP/IP, in theory at least, is relatively easy. But adding ICMP and PPP is necessary before you can write higher-level software (ie mail, web or FTP clients). The biggest problem is conceptualizing the best form of interface to Atari programming; how do you want your routines to request internet data?

Anyone wanting more info should grab copies of the most recent RFCs, which define Internet communications. Lots of information that's all necessary if you want to do it properly.

> hooked up to the Atari?

I have an external 9600 bps modem hooked into an 850. Works great. I'd
imagine you could do the same with an external 33.6 modem, though I think
you're probably limited to 9600 (?) reliably with the 850. I haven't tried
more than 9600 on it. I've heard that some have piped more than 9600
through an 850 with varying degrees of reliability. I can vouch for the
fact that 9600 works great, though. Not bad for an interface that
was made when 300 baud modems were the norm!

Yick.

> Ermm...I just realized how unpractical and hard the above statement
> would be. What about the Mac modem?

I'd imagine a Mac modem would be even worse to deal with, because I
don't think it's easy to get a cable or adapter that connects a male
Macintosh modem port with an RS232 port.

If I remember my networking theory properly, TCP/IP and PPP are on two
different "layers" (according to the OSI model). I believe TCP/IP resides
in the network and transport levels of the model while PPP is at the
session level. They're not mutually exclusive but necessary instead, as
(stated somewhat simplistically), PPP "sits on top of" TCP/IP, using its
services as part of the protocol.

This assumes I remember something from my networks course in college. I'm
not sure I'd make that assumption easily. :)

Yeah, but is it *really* about needing something to access the Web for
most of us? I'd guess that it's mostly a labor of love for everyone
concerned, a feeling that they could do it under Windoze, Mac OS, Linux,
Amiga or whatever, but would prefer to do it on their old Atari. And
a desire to support continued development for the platform to boot.

Besides, WebTV is owned by the Evil Empire.

Well, I'm not particularly in the mood for *hints* - I am going to
assume that there was some sort of teleplay/radio show/(non-major motion
picture) that you are referring to, instead of the mass release Bond
films that made it to the states, as in Dr. No.

Just as long as we agree that it wasn't Roger Moore, and this absolutely
nothing to do with 8-bit computers, but probably everything to do with
Dr. Who, I presume.

Actually, a 14.4 Modem connected at 19.2 kinda maxes out around 1100 Cps....so it is more than enough to get the best through put with an Atari 8 bit. Putting a 33.6 modem on it should work as long as it is not a "Win modem".....I am not sure, but I think there are no external Winmodems, so it really is not an issue. My advice is to pick up a cheap USRobotics 14.4 without Fax or Voice.....should be dirt cheap.....ie $10 or so....wih the proper settings it will work like a champ.

EXTREMELY possible. I would say even likely. I love my 8-bit too but
I do not choose to ignore realities like this. Don't mean to piss on
the party but wake up people.

Virtual memory won't cut it even when on a hard drive, (too much
dependence on VM makes a program crawl) but forget it on floppy. Keep
in mind most Atarians do not have hard drives. And before you tell me
about APE or SIO2PC... well if you have a PC then you already have
what you need to get on the net.

Good luck to to those who want to try, but I just feel like I'm
wishing a crazy person good luck on their next alien abduction medical
examination.

A big Hi to the UNIX/WebBrowser Guys!

I thought myself about an tcp/ip-protocol for 6502, but just for
Networking with Windows and TOS, donï¿½t ask me if it make sense.
But it would have been funny anyway.
I canï¿½t imagine a WebBrowser on the 8-Bit, especially looking on the
Gfx-modes. I use a WebBrowser on the FALCON030, and it is kind a slow
and the Gfx looks unsufficent, not just the pictures, the text too.

But donï¿½t get me wrong, i donï¿½t wanna fuck you. Go ahead. Is anybody
able to install a small WebPage for this Project??? It would be much
easier to coordinate the whole stuff, like the TCP/IP, PPP, WebBrowser, ...
activities.

> 'net. We KNOW this as Atarians.

You know, that's what bugs me. I have a PC and an Atari. They talk to each other all the time. But, (maybe because I'm not a game player) I never was wooed by what I call the "dazzle factor." For the life of me, I can't see myself sitting at either machine and "surfing" the Web for hours at a time. When I need to evaluate a site, or order something from one, I'll go there -- that's it. So, suppose your project works. I'd be the first to congratulate you, try it out, show it to all who'd see it. The guys who'd really appreciate it would be Atarians -- the others might show passing interest, but then go back to their PCs and Macs and never give it another thought. People in this community do things primarily for love and/or nostalgia. People outside of the community seem to be impressed by the glitz and/or commercial success of a piece of hardware or software. I use my PC, but I can never say that I love it. So, I have to agree with what you wrote below:

> But can we access the 'net using our trusty Atari? Yes. Here, have a seat
> here beside me and let me show you... "Why," you ask, not trying to sound
> belligerent, "bother?" I smile and don't answer for a moment.

> captivated.

You're lucky. You have a son who likes programming. It will help to develop his mind. I was a home-instruction teacher for 31 years, and got to know my students very well. The ones who liked programming were few and far between, even in the days when learning about computers in school meant learning to program in BASIC or Logo.

I couldn't have said it better.

> with one's hands to make what one needed makes me a criminal, then I ask you
> to throw away the key...

What seems like a zillion years ago, I wrote similar stuff for a now-defunct user group's newsletter. The group went almost entirely ST around that time, but I was a holdout. In the piece. I described the 8-bit as a "comfortable old shoe." The editor chuckled a little, both in person and in print, but had to agree with me. He had moved on to the ST too, but kept an 8-bit system up and running until he passed away. AND, I remember all to well my reasons for choosing the Atari (800 at the time) above a myriad of home computers that were available at the time. The reasons are still valid.

> Stepping off my soapbox once more...

Naaah, stay on it. You're among friends. We won't all agree on every little point, but there's enough tying us together to continue to call this a community.

Then do without the graphics :)
I'd be impressed just by the feat of someone programming tcp/ip on the
atari with a minimal text browswer (ala lynx). Maybe someone could do
some kind of mail implementation, too.

Hi--

I am interested in obtaining the Atari equipment you posted. Please let me
know
what condition the items are in.

I will offer $15 + shipping, using COD

Look forward to hearing from you. Lets conclude this deal as soon as
possible.

Thanks

On the 64 so does the VIC-II (on the 128 the VIC-II is unoperational in 2mghz mode), I believe the function of the SuperCPU is like an external device (more an external computer, where the 64 becomes the terminal) the original computer plays intemediary by processing the SuperCPU's video, disk access, sound etc. but all the programs are run in the SuperCPU. The hard bit is to get all the timing worked out so you don't crash the slower computer host or disk drives.

The thing is, many many sites have html in quantities well over 64k... so to support just a text only browser you would need to do quite a lot of memory management too. I don't believe that most servers support http file pointers, so that the whole request must be received at once or the the server will assume the http get request has timed out. I think it would be possible though with a heavily upgraded atari, like at least 256K. On the other hand, just displaying like the first 8-16K of a web page would be a great feat IMO. Maybe the browser could be configured to take advantage of extra memory or an APE/SIO2PC if those were available. -Dan

5252. Re: /|\ Null modem connection help!

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-20 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <75jc0fqam1@pale-rider.INS.CWRU.Edu>
Source record: 57139

```
(Clu tries to use modem and/or null modem, A8 <-> Mac.)
Try to communicate with the modem first.
Don't use Express, it doesn't allow null modems.
The cable to the 850, must be atari type. A standard 9 pin
pc rs232 serial cable won't work. It must be the atari
type cable (I forget which wires are different.)
If you can go into BobTerm and type at at the term
and get a OK, then you know the A8 is talking to the modem.
You might want to try an old 2400 baud modem. At least to
get started. Your 28.8, if you can talk to it, then
ats37=6 and atn0 should set the
modem to 2400 baud I think.
Once the A8 is talking to the modem, then you can try
the null modem attached to the Mac. Zterm on Mac might
work.
You should be able to type on A8 and see on Mac screen
and vice versa with the null modem
Russ
```

5253. Getting my SIO2PC cable to work

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-20 00:00:00 UTC
From: Tom Rosso <tommy@cache.net>
Message-ID: <uAaf2.225$43.11903@news.siscom.net>
Source record: 57140

I'm frustrated. I've built my SIO2PC cable and for the past week or so I've
been trying to get it to work. I am using APE116 and I used the 1489 design
for the cable. I've checked to make sure I soldered the wires in the right
places, and I've tried it with and without the diode. I am using an 800XL.
I don't know if I'm using APE right, though. The docs are more of a
reference than a first-time tutorial. I first start up APE, load one of the
demo disks that come with it, and then boot up my Atari, but it just does
the familiar "sputter" and shows me the READY prompt as if there was nothing
plugged into the SIO port at all. No beeps or anything.
Is there anything I'm doing wrong, or anything else that I can check or try?
Thanks.
-Tom Rosso

(Oh yes, R: handler.)
You use BobTerm, 99% sure you have an R: handler already.
You only need to change the handler if you use a 1030 or
sx212 on SIO port, or MPP or some other non-R1 port modem.
I don't think you need a R: handler with BobTerm.
Russ

Jon Melbo wrote:

> decompress a very modest GIF on the Atari8. Can you even imagine how
> long a 1.79MHz 6502 would take to handle say, even a 100KB JPEG?
Don't have to imagine. 9600 baud is pretty much a practical limit
although you can actually do 19,200. 9600 baud=> 960 chr a sec so 100k
would take about 2 minutes to load. Reducing a 100k 'lossy' image down
to the 8k of data you can display on an Atari sceen, you would have
trouble even recognizing the original image.

IIRC, some of the page flipping formats allow for ~27k of data to be put
on an Atari screen. Some of them are quite good.

I used to have a fair amount of image manipulation source code in
assembler. The actual routines for things like shrinking, expanding,
scaling, etcetera are fast enough & can be operated on the screen memory
+ a little buffer.

It comes down to a judgement call: Is a slowly loaded image that has a
high amount of detail lost worth the effort just to prove a point? I
like the point proving part, applaud anyone that does it, but not enough
to even dream of expending the effort myself. Too many other fish to
fry.

```
(about the R: handler)
Right, you have an 800, so you can't run BobTerm and have
a BASIC cart in, So the following is useless. But anyway.
I checked on my 800xl. BobTerm, when it loads will tell
you if there is no R: handler, It says 'no r: handler'.
Right. If that's the case then there are r: handlers
around. But if you can't do communications, you have
no way of getting stuff to your 800, other than somebody
mails you a disk. But anyway. What I do, which is useless
here, is run the following program. The program just
prints the HATABS table. You'd load BobTerm and hit
RESET, then turn BASIC on, then run this to see the
Handler table.
10 HATABS=794
20 FOR N=HATABS TO HATABS + 37 STEP 3
30 ? CHR$(PEEK(N));": AT";
40 LO=PEEK(N+1):HI=PEEK(N+2)
50 ? LO+(256*HI)
60 NEXT N

Make sure that the disk image you load is one of the DOS images (I like the FTE32G image, named something like that, anyway) and hold down the OPTION key while you turn on the computer. This will bypass the built-in BASIC.

Jeff

For what it's worth, citadel.org should point to several telnetable
bbs's running Citadel UX (Unix or Linux). The Citadel network
connects with computers of many platforms. Citadel 86 (PC), Citadel
68K (Amiga), Fnordadel (Atari ST). There aren't any direct connects
to an Atari, but I'd like to see one. If you connect, try finding a
room called Atari. JACS bbs (609-346-1224) definitely carries that
room, but not all bbs's on the network carry it. (Citadel allows
users to create any room the user wishes, so one could be easily
created)

(Somebody says need a autorun.sys on DOS 2, 2.5 or MyDOS to
load the firmware r: handler from 850/pr/mio).
That may be the case, which means essentially that you
have to load a file at boot to get the r: HANDLER (caps key).
Ok, I suggest to use two female db25 connectors on a three
wire cable and connect the 25 end of the A8 cable to
the 25 end of the Mac modem cable. (Older Macs anyway used
a standard 25 pin plug in for the modem, today probably
usb connector on the modem for the Mac, maybe.)
Anyway, if you use the male 25 pin of the A8 and Mac
cable, and you know your A8 and Mac cables work with
modems, then you know all the lines are correct.
Something like that.
Russ

(more on ape/sio2pc or 1489 cable).
the cable to the pc. it has to have the RI line (I made one
and the RI line wasn't there.) Or you can chose which line
to use in the APE configure menu. APE defaults to com1,
RI and some other stuff. Also while in APE configuration,
you can make sure your IRQ and port address are correct
for your port you're using. If you don't know these,
syschk or windows resources will probably tell you that
your comX port, IRQ # (3 or 4), and port address (3F8?),
etc.

Got a volt ohm meter handy? Have the cable plugged into both the Atari &
the PC serial port & I think we can guess where the rogue connection is.
Could be something simple like a problem with the color codes of the
cabe. There are two types of Atari daisy cable, one that uses dark green
& light green, one that uses something else like violet<?> so it adds
more then a few ways for following the instructions right, but using the
wrong shade of green for instance.

I figured it out. An act of sheer stupidity and failure to read instructions on my part. On the schematic sheet I have, it shows a pin diagram of the SIO port from the back of the Atari, while I interpreted it as from looking at the SIO cable straight on. So, I had the damn thing built right, only I was using the wrong color wires on the Atari end. Thanks all for your tips. Now, I'm on to download all the cool A8 software I can find. Good sites, anyone?

no, the circuit was not machine specific - it would work on any 8-bit.
whether you could fit it under the covers is another story. I think I'll do it
as an external device using the joystick ports at 2400 baud..... just
kidding!

< Own real Atari with games on tape >
However I never use those anymore, I have about 65 tapes laying around
with commercial software (mostly games, but not all)...

I translated most of them to disk, but some are hard to translate, like
the RedRat game: NIGHTMARES. This game will load the next stage from tape
when you've finished one. With TRANSDISK it can be copied to disk, but at
the last stage the game asks to rewind the tape and press return to load.
It will load the first stage again, but with other parameters, so re-boot
will not work, cause in that case you have to start over again...

Never found a working diskversion :-(

The first version will probably just forego the graphics. That way I'll have
a much better idea of how much memory we'll be looking at for the browser
itself. Once THAT is in place, along with the communications portion... THEN
we can start doing the neat little add-ons like grafix.

HOWEVER!! Just for the record... we're not talking about Java script support
here, nor frames. The user of "Project: PHOENIX" will be the user who clicks
on (HTML only/Without Frames) version. Now, with that in mind, there have
been people who have asked me about mail support. Well, if you have the
browser running on the 'net, you can always get your mail account at
Hotmail, for example, or any other free email site that offers the
straight-HTML option to their users until then, right? <wink>

Let me sum it up this way: I feel that do to the limits of the Atari8
you have to forget GRAPHICAL browsing. I do believe PPP, and Lynx
style text browsing is possible. Limits being main storage and 'mass'
storage are not large enough to handle even a typical web page these
days graphically. Most Atarians do not have hard drives. Floppies,
even if they were fast enough have too little storage. Then you have
graphical image processing time.... ever run Jeff Potter's great
programs to do GIFs and such? His VBI page flipping and color changes
to get more colrs and such? Ok think of how long it takes to even

decompress a very modest GIF on the Atari8. Can you even imagine how long a 1.79MHz 6502 would take to handle say, even a 100KB JPEG?

There is nothing wrong with text only. It's fast, it's efficient. When the 'net' was first being put together there was no web and no graphics anyway. Sure, you could ftp graphics files but they could just as easily be copies of Edgar Alan Poe books. FTP don't care.

I really do wish you luck.

>Is that okay?

I know how you feel: been there - had those "low postings" blues.

On the other hand, *everyone* getting comp.sys.acorn.misc,
comp.sys.amstrad.8bit, comp.sys.atari.8bit, comp.sys.cbm, and
comp.sys.sinclair (unless they've now kill-filed it) is still getting this
thread and its derivatives, despite it have wandered *extremely* far from
the original debate (nothing personal against recent posters, these things
happen<G>).

The same thing applies to the "C64 was crap" thread which has only survived
in three of the newsgroups.

In comp.sys.amstrad.8bit, a convention was agreed among most of the regular
posters that inserting [i] in the subject line indicated that the content
was off-topic for the newsgroup and any "purists" had the quick and easy
option of avoiding it by using a filter for the [i] (for "ignore", by the
way).

Can I suggest posters to the other groups consider using the system if the
thread is off-topic for their newsgroup. It's no big deal, IMO, but might be
a good system until someone sets up a comp.sys.crossformat.offtopic

I'm not sticking up anything resembling a firewall and would welcome
discussion of the matter.

Save your money. Compute!'s First Book was primarily Commodore oriented
and offered very little of use. The "Second" was the LADS Assembler which
required considerable editing of the source code to get it to work (the
Atari version was a port from the C=64 and the published code did not
match the assembled file). The assembler itself was just not worth the
trouble as it didn't handle nice little features like .Word and was very
slow.

If you want a good assembler, start with MAC/65 or KASM or MAE96. If you
want a good book on 6502, look for "6502 Assembly Language Programming" by
Lance Leventhal--it's the de facto "bible".

5290. /|\ Null modem connection help!

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-20 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <367CCE52.15E1@geocities.com>
Source record: 57229

For a month I have been trying to get my Atari 800 to talk to a modem/another computer.

Seven years ago I connected my original Atari 400 to a Macinoths Plus using a connection through an 850 interface... some homemade cables, and of course a null modem connector betwix them all.

The software on the Atari end was Express 2.1
Macinosh end was Mac Terminal.

All these years later, I decide that I want to get my Atari going again. I hook up my Atari (both the original 400 and a 800, both have been tested) to the 850 interface, and then try to hook to a modem/another computer.

At this point, I guess I have to wonder, can a Atari 800 ask a 28.8K modem to work at 2400 buad? I have heard, believe it out not that a 28.8 K tends to not recognize such a low speed.

But besides that, wiether the Atari is hooked up a modem, my now Macintosh Performa 550, or nothing, the result is the same....

No Modem Handler!!

Since the terminal software on both machines has aged since then I'm currently working with...

Atari - MyDos 4.5 with BobTerm
Macintosh - System 7.5.3 with Z-Modem

First off, the no modem handler problem... what exactly is being referred to here? Has my 850 gone bad? How can this be checked?

Thanks,

Doctor Clu

The day at the infomart here in Dallas was a good day all and all. The Atari Users of North Texas (A.U.N.T.) decided today to continue meeting, and will have the next meeting January 9th from 10am-1pm at Crystal's Pizza. We will try the next location and see how we like it. After the decision was made, we adjourned, and I showed off a Atari 400 playing Christmas music, and a Atari 800 demonstrating the "Ol'HACKERS" newsletter from December. It was quite a hit, especially the article on Atari saving the world from the Y2K problem and the humor articles on the flip side of the disk newsletter.
Members (and those visiting from Oklahoma) were impressed with the ease of the joystick driven system to read the articles! Many congrats to Alan on a fine job!

Afterwards I stepped over the Amiga group, which was strangely more consisted of C-64 users. Unlike the current Atari group which is more TT, ST, Falcon... later models and a few 8-bit, the Commodore tended to be more C-64 oriented with some Amiga. Weird.

But this is the kicker. One gentleman had a upgrade that is worth noting and a wonder on how possible this would be (maybe to contact the manufacturer) to get this to work on a Atari system.

It was a model known as SUPER CPU.. an interesting white metal box that plugs itself into the top of the Commodore through the cartridge slot.
Opening the casing revealed a 4-meg simm as well as the circuitry that made the processor boost of their 6502 processor to 20 mghz!

The device was simply amazing, and they believed this could be adapted since the C-64 and Atari 8-bit shared many similaries, one being the 6502 processor. But others there were more skeptical.. believing that the GTIA chip and such has a fairly tight reign on the processor's functions.

Throwing this out to the peanut gallery, what do you guys think on this? 4 meg ram and 20 mghz of power is worth a thought. :)

Can anyone here please tell me if/what value resistor I'd need for a non-Atari project! (Yes, got a few around here and there!!!)

I have a motion figurine that uses a small light that's impossible to find... since battery-'candle' lights are widely available... I'd like to do the conversion... the unit uses a 4.5 volt dc transformer.... I think that's what the bulb calls for... (I've tested... cannot figure how in the world the needle on volt meter swings to 15.. on the 15volt dc scale... can never read these things!)

Anyway, forget the sizzle... the steak part is... the bulb I'd like to use is a 3.0 volt... there everywhere (in the US, anyway...) using the bulb, as is, causes it to burn out within a short time... would a resistor work here?? And, what value?

Thanks..
Vinnie

Can you not just get a null modeb cable and hook the 850 to the com port on the MAC ??
I know Zilch about Mac's but I would think a null modem cable would do better than doing modem to modem...

Bill

Hi Vinnie--

It's very common for those little "wall warts" to measure much higher voltage with no load than with full load. They are unregulated and sag with load until they reach their rated voltage at rated milliamps out. That's why I recommend using them with care, or using a regulator or both if you use them for equipment other that what they're designed for.

Anyway, to pick your resistor, you need to divide the voltage you need to drop by the current the lamp draws. Say your supply was actually a "stiff" 4.5 volts. You'd need to drop 4.5 - 3 = 1.5 volts. Then if your lamp took 100 ma, divide 1.5 by 0.1 to get 15 ohms. If it took only 20 ma, you'd need 1.5/0.02 or 75 ohms. I'd start with something in the 15 to 75 ohm range and measure the voltage (or visually assess the brightness) and adjust from there.

Merry Christmas,

Nick (the SIO2PC guy)

It depends on the 28.8K modem. Some will drop all the way to 300 baud.
Some won't. I'd be surprised if anything labled "Winmodem" would drop
that low, but I null between my 130XE and P: R: and a 56K internal US
Robotics Fax Modem all the time at 9600 baud. I'm assuming the modem
can go to 2400 baud because it does that over a phone line to an Atari
BBS that I call.

There are basically two kinds of "handler." The ones in firmware, like
the one in your 850 require a small AUTORUN.SYS file to load them from

DOS 2.5 (can be created from the SETUP.COM file on the DOS 2.5 master disk) or from RS-232 in SpartaDos. I'm not sure how you do it in MyDos, but I remember that the AUTORUN.SYS file created with DOS 2.5 wouldn't work with MyDos. The other type of handler is a longer file that contains the actual handler code and is needed for direct-connect modems and interfaces that don't have the handler in in firmware.

UMICH has a lot of handlers. You can try them and see if any work.

I'm blushing, but I really had little to do with the mechanics of the
disk. The newsletter program was created by Kris Holtegaard (now
deceased) and modified over the years by others, including John McGowan
and Thomas Andrews. Tom did the last revision. All I did was choose
the good articles, write the drivel and throw darts to select the
programs and games on the disk :)

It varies. I read a lot of user group newsletters. Some Atari clubs
have gone entirely ST and beyond, including the Falcon clones, but some
that had both ST and 8-bit users have gone back to 8-bits alone. The ST
crowd in those groups seems to have left for PCs and Macs.

This group endured (the choice of that word needs some explanation --
let your imagination take over) many discussions of just how similar the
Commies and Atari 8-bits are. It really has to be examined on a
case-by-case basis. Maybe the manufacturer of the device will have
insights, but I suspect that unless the manufacturer can see large
profits from such insights, no information will be forthcoming. An
individual who knows and loves both machines might do better here.

While this is true, you're talking about HTML *code*. The program you view
it with doesn't show you this code, but uses it to format the web page you
view. The actual *VIEW* of the web page isn't that size. And evidently, when
I'm viewing web pages on my PC, it comes across in a stream, sometimes
pausing, sometimes not. It pauses for the grafix that may be present, et al.

If a site has an html page of 112K (or whatever size), you can be assured
that the stuff is what is making up the bulk of that page. Once
you eliminate that code from our issue, you're left with straight text of
maybe 10K or so... MAYBE! That's 10,000 characters (I'm using a rough
argument here for the sake of this discussion)!! ...Maybe!!

Now, strip the gfx links for our first version of "Project: Phoenix" so we
have a textual web browser to put out initially, and now we're getting
somewhere. The HTML interpreter will do the handiwork of receiving the and act accordingly,
stripping/ignoring that isn't
provided for in this version, format/display the rest, and voila! you're on
your way.

I'm, of course, simplifying this to an unbelievable degree, but for reason
of discussing that the Atari can handle 112K of code because you aren't
"technically" talking about 112K of code. Look at a Word document and check
out all those control codes! No wonder the silly thing is so dog-goned big!
But the document itself isn't nearly that size! Save it as a raw .txt file
and see what I mean.

The interpreter is the workhorse here, processing the code on its way to
your display.

NOW, we're not talking about *saving* those web pages. Floppies would max
out fast, unless you want the option of saving them as raw .txt of course...

and even then you might be risking some grief...

My data supports this. The amount of gain you get is not worth the pain.

After reading Bob Wooley's 80 column hack I lifted the design for his clock/dot clock & tried to see the maximum speed I could run an Atari at.

I think I ended up buying about a dozen different xtals & oscillators and combined them different divide by N counters to get some pretty good resolution.

I only tried it on one system that was a 256k Rambo with 120 ns drams. It was like hitting a wall at ~2.1 mHz. Nothing I could do would even get the system to boot at that speed.

Below 2.05 mHz but above 1.79, I needed to have a delay/pulse lengthening circuit added to sync line in order to recover video. Turns out the existing horizontal sync on an Atari is right at the absolute minimum duration to sync. You can slow an Atari down below 1.79 a bit & the video will still sync, but increase the clock just a bit & you need to fool sync.

At around 1.9 mHz, the results are pretty much completely unsatisfactory. All audio is off from the diffent clock rate, I doubt of any disk or cassette I/O would work, the screen is scruched up to the left hand side with garbage on the right.

I went through a bunch of goal/expectation lowering while I was doing this. Finally ended up thinking there was no easy way of doing this.

Figure even things like SIO speeds are derived from the system clock, so if you want to run faster you need to rewrite almost every piece of software like US Doubler Ultra Speed to the actual Atari OS.

Bob has suggested a two speed clock, one that when addresses are below 64k it runs at 1.79 mHz, and another system clock that lets a 65816 take advantage of its increased speed in memory above 64k, but that leaves out the average user since on average we don't have a 65816.

I think that is ~what the SNES does with its 65816, so it is doable & reasonable.

Jumping in. Way back when people were insisting on running sio2pc/ape from some flavor of Windows, I asked Steve about making a version of Ape that worked off a higher priority interrupt then RI on a PC. I don't think there is a lower priority interrupt on a PC<grin>.

Steve is great to work with, one of those guys like Wooley who gets more done then a normal human being. I think there was a patched version of APE next time I checked my email.

Unfortunately, from my end that is about where the story ends. What happened was the same day I got the patched APE my son came over & saw me booting an 8 bit from an clone running Windows. Got a total of about 2 boots done testing it<seemed to work better>, & it walked out the door with my son. I was kind of the weak link in getting it tested right, but that is my SOP for people that know me.

>Anyway, to pick your resistor, you need to divide the voltage you need to
>drop by the current the lamp draws.

I'm missing a piece of the equation... bulb has no markings, nor the package..
other than that it is a 3.0 volt bulb for battery operated candles... (Type
used Christmastime... probably uses 2 AA's... that's a guess...)

Any other way to figure?
Thanks..
Vinnie

```
(Dr. Clu wants to know if his 850 is working.)
Uhm. YOu said you have BobTerm. I checked. I'm pretty sure
BobTerm will load the 850 firmware handler. So, I suspect,
you are running BobTerm and getting a 'no handler' message,
meaning BobTerm can't find your 850, meaning your 850
isn't working.
*************
Here's a 88 byte R: handler. You can type it in in BASIC,
then test your 850 with:
10 CLOSE #1
20 OPEN #1,8,0,"R:"
30 PUT #1,10
40 CLOSE #1
*************
If above causes error (130 I think, 'unknown device'), then
your 850 isn't working.
THE HANDLER:
************************
10 CLOSE #1
20 OPEN #1,8,0,"D:850.HND"
30 FOR N=1 TO 88
40 READ X
50 PUT #1,X
60 NEXT N
70 CLOSE #1
80 END
1000 DATA 255,255,0,56,75,56,169,80,141,0,3,169,1,141,1,3,169,63,141,2,3
1010 DATA 169,64,141,3,3,169,5,141,6,3,141,5,3,169,0,141,4,3,141,9,3
1020 DATA 141,10,3,141,11,3,169,12,141,8,3,32,89,228,16,1,96,162,11,189,0
1030 DATA 5,157,0,3,202,16,247,32,89,228,48,6,32,6,5,108,12,0,96,226,2
1040 DATA 227,2,0,56
*********************
Of course, you binary load the handler before testing to see.
You can use the other BASIC program for the HATABS to see
the R: handler is there.
Russ

5313. Atari800Win with large ATRs?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-21 00:00:00 UTC
From: Sydtech <REMOVENOSPAM_sydtech@sydtech.com>
Message-ID: <75m9j1$o1m$1@jair.pressenter.com>
Source record: 57102

I've just started experimenting with Atari800Win, and I'd like to be able to take some of the large ATR images I'm using with my REAL Atari 8-bit setup and APE. Unfortunately, I'm having a hard time getting Atari800Win to read or load from any of my larger ATRs. What's the way to get these working with Atari800Win?

It'd be really cool if there were a way to get Atari800Win to work with APE, which has some really cool support for direct PC hard disks, and a menuing system.

You could cheat a bit. Just get a pot that handles ~1-3 watts, maybe 100
-500 Ohms. Make sure you have it at maximum resistance & crank it down
until you get the brightness you want from the lamp. Then read the
resistance off the pot with a VOM & buy that part for space saving.

There are more complicated solutions too, like current regulators, but
Nick's analysis of the probable values gives a good jumping off point
for what pot to buy.

5316. Atari BBS list -December 1998

Newsgroup: comp.sys.atari.8bit

Westex : 610-776-7495
No BBS/ Number reaches Westex Answering machine.
December 20, 1998

/|\ UNCONFIRMED ATARI BBS NUMBERS /|\

These are Atari BBS numbers that were gleamed off BBS lists when
calling the above BBS's. They have not been called yet, (since I'm
still waiting for the damage report of the phone bill of the ones I did
call) You will probably find some repeats, and there is no way of
knowing how old these BBS lists are though we already know some of these
work. If you can confirm any of these, please send the results to
"clu-da-bard@geocities.com"
Again, forgive the repeats! Before calling a number, it is suggested
to check the confirmed lists (the working numbers at the beginning of
this file, and the dead BBS's at the end of this file) In the future,
and with your help, we will have this section of the Atari BBS's file
more accurate and organized. For now, it is here to provide possible
other numbers that might still be active.)

/|\ ATARI BBS's INTERNATIONAL /|\

The following are BBS's outside the United States of America, in which
I didn't confirm (mega-long distance cost). You will probably find some
repeats, and there is no way of knowing how old these BBS lists are
though we already know some of these work.
If you could confirm these or add other numbers, please write
"clu-da-bard@geocities.com"

/|\ TELNETABLE ATARI BBS'S /|\

The following are actual BBS's hooked up to the internet that contain
Atari support in some form or another. (I am especially interested in
finding other telnet links! If you know of any, please write
"clu-da-bard@geocities.com")

JACS - (Telnet Address please!)
Doc's Place telnet://bbs.docsplace.org (Forem 163)

/|\ FORMER BBS'S THAT BECAME WEB-SITES /|\

More or less a "where did they go" category. The following were once
BBS's that changed over into a website in recent times.

A.U.N.T. http://atariusers.com/aunt/
Closer to Home http://cth.tzo.com/index.html
CSS: http://www.nleaudio.com/css/products.htm
Sir Smedley's BBS http://home1.gte.net/smedley/index.htm

/|\ DEAD BBS'S /|\

The following are BBS's that were called during the time of December
17, 1998 - December 20, 1998. All were given 7 rings minimum.
Disconnected - received automated message saying it was so.
Voice Answer - Someone who I apologized for waking up. :)
No Answer - No tone or voice in 7-10 rings.

Please remove these from you BBS lists. If you have further updated
information, please write to "clu-da-bard@geocities.com"

Atari BBS list, maintained and started by Trevor Holyoak
(Trevor@holyoak.com) and displayed on the "Atari Planet" website
(http://www.holyoak.com/atari/). This update written by Doctor Clu
(clu-da-bard@geocities.com) on December 20, 1998.

5317. Atari 8-bit Auction - 2 Days Left!!!

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-21 00:00:00 UTC
From: "Mark H. Kusz" <mkusz@tir.com>
Message-ID: <75mfqh$h6s$1@ramp2.tir.com>
Source record: 57106

Rules:

Auction will expire on midnight 12/22/1998 EST. Bidders are required to include (1) lot numbers, (2) item description and (3) mailing address with any bids. Seller is obligated to sell items to the current high bidder and may do so at any time during the auction.

Please do not bid unless you intend to purchase. Good luck!

All items have been tested, unless noted.

One that works for me: I use five 6-amp diodes in series to drop the 12VDC from a PC power supply to 9VDC for my MIO and XEP-80. The 6-amp rating is over-kill but the're cheap and "better safe than sorry". The trick is each diode provides a forward voltage drop of 0.6 volts. In your case, why not experiment with two or three in series.

BTW the diodes tend to run a lot cooler than resistors.

John

5320. Looking for System ROMs

Newsgroup: comp.sys.atari.8bit

This may be completely off-target, but I had a 320XE that worked sometimes and
didn't work sometimes. Turned out to be the power supply. Power was _getting_ to
the machine (the power light came on) but for some reason wouldn't make it actually
boot sometimes (I had always thought that there was something funky with the memory
upgrade that occasionally killed it. I finally figured it out when I needed to
test an XE to MIO card and the thing wouldn't come up. I subbed in a known good
130XE, and it died in a familiar way. Swapped the p/s, good to go).

there was a speedup for the ST and amiga called ADSpeed which basically
replaced the 68000 which was basically an internally doubled clock,
something like this might work, obviously it would be costly to actually
make a 6502 compatible to match, but perhaps a board to solder/socket in
place of the 6502 holding a clock doubling/tripling/quadrupling cct and a
high speed 6502, and would probably need some kind of cache for writing to
memory etc at a speed they can handle.....

> rest were CUT! Obviously it was a VERY confusing story.

The last ever story (or at least, the last one before the TVM in 1996)
was Survival, which is three episodes long. I don't remember there
being any extra footage for that one (a lot of Sylv's stories had bits
cut due to make them short enough, sometimes bits that were fairly
important) but I've not got the commercial release, just an off-air.

That said, I don't remember it being a difficult story to follow either,
but I only needed to watch Ghostlight twice. =-)

Andrew:

Make sure APE is set to the correct COM port, and that the control method
is set to RI, and not DSR or CTS. Assuming you built the 'standard' cable,
only RI will work.

These are about the only 2 settings that would cause total failure. If there
is still no response try another COM port, and recheck your connections.

Hi guys! I'm still here, lurking.

For some metrics on how fast the ol' 6502 is, try copying a small .gif file from most any web page you access on your PC, and viewing it on your Atari with one of my GIF viewers (APACVIEW, COLRVIEW). It's annoyingly slow!

I did some preliminary study into decoding a JPEG file on the 65816... it would be even slower due to the poor support of 32-bit math on that chip (and even worse on the 6502).

So go for a Lynx clone, is my advice on your web browser project. If you get 99% of the way there, and need to load .gif files, write me back :^)

That is not too weird. I noticed that very often.
Acorn Users are somewhat different.. they consist of C-64,
Atari and even CPC-users in nearly the same number.

> made the processor boost of their 6502 processor to 20 mghz!

I have this device for my C-64 equipped with 16 MB of
memory. It has a WDC 65816 Processor onboard, that has the
same instruction set like the 6502, but enhanced with some
more instructions for 24 Bit adressing, and 16 Bit
accumulator and Index-registers.
It runs 20 Mhz and is an AMAZING device.
But it runs the own memory and the own chip at 20Mhz, the
internal 6510 of the C-64 is disabled.

> The device was simply amazing, and they believed this could be adapted
> since the C-64 and Atari 8-bit shared many similaries, one being the

I believe this is in fact possible. The SCPU has an own
memory that is mirrored to the original C-64s memory, to
make it visible for the VIC (Video Interface Chip).

> Throwing this out to the peanut gallery, what do you guys think on
> this? 4 meg ram and 20 mghz of power is worth a thought. :)

Forget those 4MB RAM.. it is up to 16 (read my lips: "six-
teen") Megabytes of RAM!!

Information on the SuperCPU accellerator can be found on
http://www.cmdweb.com

why not ask them if they could build one for Atari ?
They even managed to build one for the C128.

An APE or SIO2PC cable doesn't make use of CTS RTS? Is there a 'non
standard one' that does? Is it better or doesn't it matter?

Source record: 57175

The idea of adding memory via SIMMS is attractive, however the speed upgrade is not likely, The ANTIC and the SALLY (6502c) are directly tied to one another and its unlikely that the ANTIC will work at any speed other then the 1.79, however there is a command to shut down the ANTIC chip, now all you need to do is design an alternative video card (I used to do this when I ran an Atari BBS on an Atari 800 computer, I had a BIT-3 80 column video card in Slot #3 of my 800, using a USR command I would activated it and then using another command I would turn off the ANTIC chip and nearly double the speed of my system which was quite useful in processing user requests and seemed to help in allowing uploads and downloads. So if some sort of upgrade were to be done, then perhaps the answer is using the XEP80 interface and shutting down the ANTIC and running in 80 column text mode with a high speed 6502c, kind takes away from doing anything graphically though :(

I have been tinkering with various 800 XL's as of lately. I have to admit, the first experience I had with a 800 XL was not the best, especially after having a simply upgraded 400 for years. I bought the first Atari 800 XL at Federated for $79.00.
Got it home, had to hastle with option keys to turn a built in basic.. what a mess.. and not all the programs worked that had no problem working on the 400/800 (I would find out later why that was the case) :)
That 800 XL blew out one day, (probably just a loose processor from one of the sockets now that I look back on it) and we took it to a repair shop that closed down months later.

Still, honestly... I prefer a nice Atari 800 even with the problems mine has (blown out Joystick 2 port.. arg!!) However, for my sister, I have found a beautiful 800 XL with leather cover.

Amazingly, it worked for a short time, then didn't work. I did some swapping around of a good board into the nice looking case... Nice... works fine. No RF shielding was installed, seems the later models of the TV cords with the rectangular box took care of a lot of the static. Then I reassembled the non-working board in the 800XL case that was not so good looking. Once again leaving the RF shielding off. And low and behold, it worked. :)

Is there just something inherently evil about the RF shield on the 800 XL? :)

Doctor Clu

PS: Have to admit, I love the 800 design for it's easy access ram boards... but the 800XL and all the socketed chip are NICE as well. I can see why many like it. So which chips can be interchanged for that ram upgrade? (grin)

The original message said *salivation army* instead of *salvation army*.
Salivate means to produce saliva and the salvation army are fairly
god orientated hence dribble for god.

I can't believe I had to explain that...

> cartridge. How common ARE those these days? Is it a possibility
> or reality? I know for sure that 64K bankswitchable cartridges
> (Like the "Six Pack") exist. But 256K?

You can in fact have ANY size EPROM/ROM you wanted. the 64K uses the 1 Byte
of memory each bit would toggle an 8k bank in or out thus 8 banks * 8K =
64K. Use two bytes and you get 128K (I guess the 256K comes from, if you
could access 16K of memory directly from the cart port?)
So just decide how much memory you want on EPROM/ROM, divide by 8 and that
will tell you how many bit you require for the decode logic to access this
memory, divide by 8 again and thats howmany Bytes you need. don't get too
greedy every byte you use for decode logic is one you cannot use for
program space
>
> If this does exist, we would have to allocate them to 8K

> the pieces together and creating a spread sheet.

I think I would stick to 8k allocations most tool's you write should fit in
to that sort of space, you arn't moving the sort of memory around PC do.

> Is there just something inherently evil about the RF shield on the 800
>XL? :)

Wow. you've had some bad luck. I've played around with many Atari
8-bits. However, most of my Atari time has been on two 800XL's (mainly
because I have so many spares in case something goes wrong). Unlike
crappy Commodore 64's, which seem to find any reason to stop working
forever, the Atari's have worked *almost* flawlessly, Never had an RF
shielding related problem. Here's a list of problems I've encountered
with Atari 8-bits:

* Found an Atari 800 thrown out. 3 keys didn't work. Had to resolder
the contacts.
* Long, long ago, my original 4 port Atari 5200 game machine had
jostick problems. turned out the motherboard had cracked around the
joystick connector (probably caused by constant swapping of the
joystick between joyport 1 and 2 in order to play WIZARD OF
WOR..which, if you didn't know, REQUIRED player one to be connected to
the SECOND joystick port! STUPID!!!!!) Motherboard hosed. Good for
parts.
* On an Atari 130XE, half the keyboard didn't work. Turned out some of
the conductive "paint" on the keyboard's plastic membrane had been
eaten away (by what!!?). Solution was to go to an automotive store and
purchase a window defroster repair kit (which contains a small vial of
conductive paint). This repair kit has come in handy for other
projects. Highly recommmended.
* A garage sale Atari 800 didn't work. After about an hour of swapping
IC's with an Atari 400, I found the offending chip and found a
replacement.
* Way back in the 80's, my original Atari 800XL started to act weird
(strange buzzing through the TV speaker and a reddish horizontally
striped tint on the display). Had to replace the external "brick"
power supply. Damn thing was only a year old!

NOTE: I have roughly 30 Atari's (all but 1 work) and almost as many
Commodore's (about 2/3's work).

Ah this takes me back, one of my favourite 8-bit games!

I haven't come across it on cartridge, or even heard of it being
available on cartridge.

Drop me an email with the subject being 'WANTED: M.U.L.E. On cartridge'
to asx@steverosie.demon.co.uk and I'll see if I can track it down
(that's if it was on cart.)

Howdy

Mac modems might not work on anything but a MAC. The MAC has things (inside the computer/OS/somewhere) that other computers don't have. SO they need less to operate a modem. I have ROMs in my Supra V32bis that have voice capabilities. But you can only use them if you use them with a MAC.

So you better try your external MAC modem with another computer first.

I don't think you really need a "RF converter" (i.e. RF modulator). The TV output is already RF modulated. All you need is to plug the Atari output into the 75-ohm, cable TV input on the television. If you've got an old TV that uses 300-ohm, you need exactly the same kind of adapter (a balun) that is used to hook it up to cable or a VCR.

No, the regular cables use the RI line, but you can connect it to other
inputs if need be.

I added RTS support because the windows comm drivers respond much faster to
it than they do RI. Win95 does not even fully support RI, just a ring
indicator. Not an issue on fast machines, but does improve
performance on slow machines. Rick Cortese initally suggested it.

CTS support is for Mac PC emulators.

Learn how to use DOS. (Hint: L is the correct option in DOS 2.0)
Or use Sidload - it could be found here:

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

5354. ST mouse on Atari 8 bit

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-22 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <75ob8s$p9n$1@nets3.rz.RWTH-Aachen.DE>
Source record: 57119

Howdy folks

Rafael wanted to know about the Right mouse button, well.

The right mousebutton is connected to pin 9 of the joystick. This is an analog input. So we have to do something to the mouse.

Open the sucker and look for a resistor marked R4. If that is the case, we do not need an extra resistor. Just solder a short wire from to R4 (which side apparently doesn't matter (my mouse doesn't have R4, so I could never test it) to the point on the print where the mousecable connectors white wire is connected. (again I have not tested this)

If you do not find an R4: (I tested this)

Find the mousecable connector. On it, find the red and white wires and connect a 4700 Ohm (4k7 OHM) wire between it. These should be connected to pins 9 and 7. (it's better to rely on the numbers then the colors. Atari might have changed colors. There are atleast 8 different version for the ST mouse (not counting the ATARI-PC mice, which look the same but are even cheaper).

I stuffed the resistor into the mousecable connector. That way it's easy to disconnect.

Try:

```
10 paddle(0)
20 goto 10
```

To see if the right button works. (if you plug it into port to, replace paddle(0) with paddle (2))

The value returned should be 228 when the button is not pressed and NO LARGER then 9. In my case a resistor of 4700 Ohm returned a value of 3, a resistor of 18000 Ohm (18kOhm) returned 8.

Now for the routine (this is taking a bit longer then I had hoped, so I'm again running out of time).

The following trick was taken from the no longer existing Pokey magazine by ANG software. John Maris himself said in the article I'm extracting the following from that he was releasing it to the PD.

John Maris: "We take the old mouse value and shift it left twice (multiply by 4) and add the new value. This turns two 2bit values into one 4 bit value. The first to bits are the bits we read latest and the last two bits are the bits we read just now. This way we get 16 unique values dependend

on two values measured right after each other when we move the mouse. The result we use as an index for the action table.

An example:

Old value: 2 (shift twice makes eight)
New Value: 1 (one plus eight makes 9)
Index value: 9

I wrote earlier (remark: I've left most of the article out) that a 2 followed by a 1 represents a move to the left. So we have top lower the X-pointer by one. This is done by placing 255 in the ninth position of the action table. (adding 255 is like substrating 1)

Old value 1 (shift twice makes 4)
New value 2 (plus four makes 6)
Indexvalue 6

A 1 followed by a 2 is a move to the right. The X-pointer has to be raised by 1. This we represent by placing a 1 in the action table.

Conclusion: we grab the previous value, shift it twice and add the new value to it. The result of this we use as an index and use this index to retrieve a value from the action table. This we add to the original X-position, resulting in the new X-position. For the Y-position we use the same table.

Sometimes we get the same value twice (old=new).
This can mean two things, either the mouse didn't move or it moved to fast. You can not test this, since you still do not know if the action was to the left or to the right. In these cases we place a zero in the table. Meaning "no Action". The cursor stays where it is.

The same goes for the values 1 and 3. There are two steps between them, but you don't know whether they where right or left. So again, no action. A zero in the table.

Last but most important part of the text. If you're not 100% sure what action to take, don't do anything. This prevents "shaking" or reverse movement of teh mouse."

That the most important part of this text. I translated it online, so it might contain a few ruff spots.

I'll check again if I can find the source John talked about in the article.

> or load from any of my larger ATRs. What's the way to get these working
> with Atari800Win?

This works, as far as I know, providing you have the right pieces. First, the ATRs need to have valid headers (many don't, unfortunately). Second, you need to be using an appropriate DOS - namely, later versions of MyDos - that understand very large sector sizes.

> It'd be really cool if there were a way to get Atari800Win to work with APE,
> which has some really cool support for direct PC hard disks, and a menuing
> system.

Atari800Win already directly supports PC hard disks and has a menuing system for floppies. There is further functionality (reading protected disks) that is more interesting in APE, and I've asked the author already about working together for that.

Cute...

I would suggest ImageMan from the Umich archive (check the faq for the
address). It's quite good at creating ATR files that you can then browse
the hard drive for Atari files to add to the ATR.

Good luck,
Steven

>Raiders _and_ Privateer right on your PC!

I've been playing it on various emus for over a year now -- my wife can't stand it! It's a little tough to play with my Thrustmaster stick, since it's analog and you have to throw it a LONG way before the ship will move. I enjoy the game much more with the old Wico Bat Handle on the 800.

<snip>

>Welcome from the class of '82!!

Cool! I actually got my Atari 800 for Christmas of '82 and the only carts I got with it were PacMan & Star Raiders. It took me over a year to get to SCC1 but it was well worth it.

Steven

Yeah, I'm still working on it. The OCR routines are doing a pretty good job with the text, but I don't like how it's formatting everything, so I'm going to try to work on it some more this week. Christmas Eve will be quiet here, so there should be plenty of time to work on it on Thursday. I'll try to let you know when it's done.

Steven

5369. Re: Cart reader!

Newsgroup: comp.sys.atari.8bit

From: "Derek R. Pizzagoni" <drp@aval.com>
Message-ID: <36804424.540FEFB9@aval.com>
Source record: 57134

I have an item called 'Cart Clone'. I used it to back up all of my
cartridges to disk. Now I can run them without the original cartridge.
I ordered it back east around 1982 or 1983. I'll look to see if there's
any brand name or anything.

In any case, the answer is 'yes'. It does exist. I do not know what
format it stores it in.

5370. RF converter for Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-22 00:00:00 UTC
From: "Derek R. Pizzagoni" <drp@aval.com>
Message-ID: <36804755.A33B1B8B@aval.com>
Source record: 57135

I have 2 Atari 800s (one w/a bad keyboard) at home, and have recently decided I'd like to poke around with one of them again. I was all set, until I found that I'm missing the RF converter (TV/GAME switchbox). Radio Shack doesn't sell them. Does anyone know where they can be found?

Hello everyone!

I have the following atari Compute's books left for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each
plus shipping. I would suggest the 3 day shipping as it is only $3.00
and gets the books to you quickly at a reasonable price. Please e-mail
me if you are interested in any of these. Thanks!!

Douglas Carroll

5373. Apple II Monochrome Monitor with Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-23 00:00:00 UTC
From: cv436@torfree.net
Message-ID: <F4EB4B.JE0.0.queen@torfree.net>
Source record: 57041

I'm wondering if the Monochrome monitor that came with a Apple II CS+ will work with the Atari XL/XE? It looks like a standard composite connector, you know, the RCA type jack.

I would imagine that I should be able to hook up the luminance connector from the XL/XE to the monomonitor to get the display to work?

Later...

5374. WANTED: Fort Apocalypse ATR (for Atari800Win)

Newsgroup: comp.sys.atari.8bit

I also have a hard time with my Flightstick Pro, especially selecting
sectors to jump to.

Yep, I had a Wico back then. When I saw it had a button on top and
suction cups so I could stick it to the table, I knew it was the stick
I was looking for. Imagine, being able to steer and shoot with one
hand while controlling the keyboard with the other, what a concept!!

>>Welcome from the class of '82!!

>
>Steven
>
I still have my receipt, dated 11-30-1981 (oops, I'm from the class
of 81 then!). Bought an Atari 400 w/16K for $348 and Star Raiders
for $47.90. Sped home, hooked it up to my color TV, plugged in the
cart, and turned it on. Hit the Hyperwarp key and my brain sizzled
and drained out my ears onto the floor. Nothing I have ever seen on
a computer since that moment has ever blown my head off like the first
experience with this game.

Salute!

5380. MyDOS 4.53/3 and RAMdisk

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-23 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <75qjm9phf1@nets3.rz.RWTH-Aachen.DE>
Source record: 57048

Howdy folks

As you all might remember I've been having this weird problem with MyDOS 4.53/3 (haven't tested other versions of MyDOS yet).

If I boot my 1MB (30 pin SIMM) XE without BASIC, everything is OK.
If I boot it with BASIC, the directory is empty, but the free sector count is just like when I boot without BASIC (and as it should be).

So yesterday I played around a bit. First told MyDOS (via Option O) to use only 256kB, then 512kB. Everything seemed to be OK. Booting with or without BASIC made no difference. So I tried the following:

```
--------
Drive Number or RETURN: [Return]
Verify WRITEs? [N]
Number of File Buffers? [3]
RAM disk present? [Y]
[A]xlon or [X]E type RAMdisk? [X]
Use default config for 1024? [N] <----
Size(K)? [1024] <----
Page sequence? [Return]
RAM disk drive no? [9]
--------
```

Then saved DOS to disk.
Now it does not matter if I boot with or without BASIC. (with 256k and 512k this is the same)
But now, if I copy files to the RAMdisk, the directory gets overwritten whenever I use more than somewhere between 800 and 900 single density sectors. Up till 800 sd sectors everything is OK, then shortly after that the directory is overwritten. (haven't tested that with 256 and 512k. It was late last night. BTW 256k means I tell MyDOS to use only 256. There IS 1MB inthere)

Can anybody make sense out of this? (800 to 900 sd sectors that's about 110kB!?!?!?)

CU Mathy van Nisselroy

PS I'll probably not be able to read mail before the end of the first week of january. But I will read c.s.a.8 from my home.

Best wishes to all, and don't get bit by the millenium bug!!!

Hi!

I did this. It does work, but you should add an external speaker (with amplifier) to hear any sound. And furhter, my apple 2c monitor doesn't display everything nice in the center of the screen (more at the bottom). And some annoying sprite stuff at the right of the screen..

So it DOES work, but not that great I hoped...

Marius

Hi Mathy!

For your type of ramdisc (you use D301: PB0,PB1,PB2,PB3,PB6,PB7) you must
answer the question for your 'Page sequence? ' with

20,21,22,23,24,25,26,27,28,29,2A,2B,2C,2D,2E,2F,
60,61,62,63,64,65,66,67,68,69,6A,6B,6C,6D,6E,6F,
A0,A1,A2,A3,A4,A5,A6,A7,A8,A9,AA,AB,AC,AD,AE,AF,
E0,E1,E2,E3,E4,E5,E6,E7,E8,E9,EA,EB,EC,ED,EE,EF

to access all of the 1MByte.

if i remember correct, you must close this with 00 or FF,
read the MYDOS manual for details.

bye, Andrï¿½.

5386. Re: RF converter for Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-23 00:00:00 UTC
From: "Derek R. Pizzagoni" <drp@aval.com>
Message-ID: <36812DFD.C28A37A3@aval.com>
Source record: 57054

My TV is about 5 years old. The only input it has is the standard screw-on cable input. I thought about hooking the Atari directly to the video-in on my VCR, but I didn't think I'd get any audio, even if I did get the video to work.

I found a TV/GAME switch at Fry's Electronics last night. I brought it home, hooked it up, and it appears to work, but I think I need to get a better adapter (the 75-ohm to 300-ohm converter/balun), because there was a bit too much static, and I could make it better or worse by moving it around.

At least I got it to work again. :) Now to see if all of the peripherals work... (410 Cassete Drive, 1020 Modem, 850 Disk Drive, 1050 Disk Drive).

I'm so happy to know that there is still some life left in my first computer (first love?).

Hehe.. how to let others know the nostaligia that we all share?

So far my lady is impressed. Think she's happy that I assmebled a fairly cheap Atari computer system rather than getting a $1200 iMac (so I could emulate a Atari).

I have a Atari again, my current Macintosh is excellent since that is taken care of, and I'm no longer gripping about getting a iMac. Thus all the more money I can spend on my lady.

My lady is impressed. ;)

Merry Christmas!

I have three R-Time8 carts... all used to work just fine. About a year ago, all three stopped working.

One of them (when plugged in), wont even allow the computer to boot. The other two arent detected and wont hold time.

Any suggestions appreciated?

hello!
I noticed that there is a problem with ST-Mouse, but I can't imagine
what it is. If you need a routine which deals with the mousse, I can help you.
I've got two. One in an Timer-interupt slows down the whole system and
one which halts the system - not the interupts, of course - until you press
left or right(the "strig(0) < 10"-way) button.
please just ask for it, if you really need them, 'caus I would have to
searche them really bad and I've got no XL-System running at the moment.
ciao

Source record: 57072

I absolutely love this game, and I've finished it several times, but there's one thing that keeps bugging me...

In the second (green) cave, there're two tunnels down to the lowest levels. These tunnels have blocks that move up or down. They must be moving down in order to get through the tunnels.

I can't find the way to _make_ those blocks switch directions when I need them to. If they're going down, I can win. If not, I have to crash my copter and hope they've reverse on my next one.

Is there a way to purposefully make those things switch direction?

Thanks,
Jeff

A few days ago I received a package in the mail, containing a shrinked Atari 8-bit computer game, Demon Attack. Well, it sat here for a couple of days until I finally got around to tearing the shrink wrap off of the game box; here is what I found... TWO Demon Attack instruction manuals, TWO Imagic game catalogs, TWO warranty cards, and NO CARTRIDGE!!! This certainly appears to be an original factory shrinked game (it still had some very old price stickers attached to the shrinkwrap) and the contents were otherwise completely mint. In fact, the same seller also sold me 5 other boxed 8-bit games, and they were all complete as advertised, so it appears that it was definitely a factory screw-up. I didn't buy a whole lot of new games back in the day, but I have opened many dozens of shrinked Classic games in the last couple of years, and this is the first surprise or unusual occurance I have come across. Also, needless to say, the extra 8-bit Demon Attack instruction manual and Imagic catalog are available for trade :)

---> SPAM-BLOCK engaged; for REPLY mail please
remove the 'z' from mjzbeau@texas.net

By the way, the Imagic catalog is # 700500-1 Rev.D
I already have Rev.A and Rev.C, so I will happily swap for Rev.B
(or whatever other good catalogs or instructions you might offer)

I'm not so sure of that. I'll bet Tom Baker or John Pertwee could have made the stories that Sylvester got stuck with a lot more interesting. The only time I considered McCoy's acting to be good was on that otherwise awful Fox TV special where he regenerated....

I started off using my 130XE being hooked up to my ATI All-In-One Pro video card, which has the same (cable) connection as the Hauppauge tv tuner and it worked fine (composite mode). Of course, now I use a tv set because my son uses it when he comes to visit; so I have it on another desk.

Happy holidays, guys and gals, and a happy, healthy New Year to all.

BTW, I got an announcement from Microsoft's Y2K department, stating that
the release of Windows 2000 will be delayed until second quarter, 1901.

Take care.

Hi Lance!

Releasing Zybex on ROM is a great idea!
The nice thing is that the game works flawlessly on NTSC systems.

I think the rights to all Zeppelin Games (Zybex, Draconus, Mountain Bike Racer,
Cavernia...) were sold to Derek Fern in the UK (Micro Discount).
The games were originally on tape and he wanted to release disk versions.
It seems Derek's site is down, but he may be reachable by phone...

Atarily,
Bertrand M. (LEXX)

One of my all-time favourite scenes is from Remembrance of the Daleks,
the "didn't we have trouble with the prototype" bit. And the line they
cut "Oh Davros, I'm so much more than *just* another Time Lord" was
wonderful...

> He wasn't bad in the Fox film tho, was he? Considering the short
> lenght of his part ... carried off the "end of regeneration" bit
pretty well...

Unless you've seen the *full* version of the operation scene that was
shown on US and Australian telly, the final scream is a tad over the
top... =-)

It's worth having the Australian version, it's PAL, it's longer
(including the scene where Chang Lee's mates get shot as well as the
bullets just bouncing off the TARDIS) and it's not been darkened off to
look like an episode of the X-Files! =-)
--
Jason =-)

Hi!

I recently downloaded some scene demos from a polish ftp server - they
are all DC3 files!
Question: What to do with it to get it into ATR?

DC3 seems to be no special emulator format, but an original file format
(?). However, when I had an Atari 800 XL myself, I never had a DC3 file,
so what's this all about?

Thanks for your attention!

High Crimes and Misdemeanors

What are high crimes and misdemeanors? Is it too much to assume that rational people would rise up in protest if the President defendant had indeed committed high crimes and misdemeanors? Does anybody who is reasonable and seeks to uphold the rule of law, actually believe that the public would tolerate a President who is in fact guilty of perjury, of obstruction of justice and of abuse of power? The standards of the vast majority are clearly too high to dismiss the sort of abuse that is alleged. But most of the charges have proved to be so utterly preposterous that they collapsed on their own transparent frivolity. The only thing that remains is the McCarthyite charge that crimes were committed but details cannot be exposed. It's the old, perpetual, pending investigation gimmick -keep the target under investigation, claim phony secrecy privileges and he or she is always a suspect. And that is the sort of suspended animation that produced the desperate charge that President Clinton is guilty of perjury -but who says?

That is the question and it not entirely facetious because it goes to the heart of "specific intent". In particular, perjury is a specific intent crime that relies upon the mindset of the defendant. When, for example, Monica Lewinsky said she hadn't had a sexual relationship with Bill Clinton, she was telling the truth because Monica Lewinsky made a clear distinction between what she called "fooling around" and sexual intercourse. It is Linda Tripp who ultimately insists that Monica committed perjury because she is the one who persistently quarelled with Monica, in effort to plant in her mind, the necessary elements that are required by law, to expose a target to the charge of perjury. It all sounds absurd and difficult to imagine but it's all on tape and the charge cannot simply be dismissed. Blinded by the mentality that the end justifies the means, criminal perpetrators do not appreciate the scope of self-incrimination. On tape, Linda Tripp is heard clearly insisting that Lewinsky and Clinton had sex, and she aggressively disputes the "fooling around" characterization

that Lewinsky firmly believed. Indeed, she pushed and pushed and pushed to the point where Linda Tripp claimed that if you have an orgasm, it's sex. Can you imagine a grown woman, any grown woman, arguing with a young girl, any young girl, about the definition of sex? Can you imagine a grown woman, any grown woman, insisting that orgasm equals sex? Is masturbation also sex? If they are willing to re-write the dictionary to expose the President of the United States to the charge that he committed perjury, is there anything that they are not willing to do?

Like Linda Tripp, attorneys for Paula Jones were preoccupied by the bizarre obsession to define sex. In the end, the tortured definition they produced provided Bill Clinton a cover to deny a sexual relationship -and the trap was sprung. But it was a trap with an illusory bite. Perjury is not the failure or the reluctance to expose a sexual play by play. It was a nice try, but it was a trap that lacked substance and demanded the sort of zeal that reasonable prosecutors reject. Moreover, if collusion between Linda Tripp, the Jones camp and the Office of the Independent Council is responsible for the parsimonious definition about sex, the astounding scope of the behind-the-scenes set-up reflects unethical, clever lawyering, to say the very least. Having deliberately limited their questions to encourage Clinton to mislead, it certainly takes extraordinary contempt for the law to turn around and call that perjury. There is indeed no limit to the stretch of reason that Clinton's accusers claim. They even have the unbridled arrogance to call Jones versus Clinton a Federal civil rights action. Frivolous on merit, bogus on substance, Jones versus Clinton was about abusing the court system to procure a perjury charge about a non-criminal matter. Lawyers for Paula Jones essentially betrayed the fact that they were more anti-Clinton crusaders than advocates for Paula Jones when they claimed that Clinton was guilty of perjury, obstruction of justice and abuse of power. Having oblitherated the distinction between the Jones camp and Starr's office, it is clearly naive to deny the evident collusion. Indeed, the assault was essentially treasonous, because Monica Lewinsky and the Jones case were used in a manner which was tantamount to manufacturing justification to criminally indict the President of the United States.

And when the Jones case was thrown out of court, even the inconsistent Dick Morris, the very man whose rhetoric is selectively used to demonize Clinton, claimed that Paula Jones owed the entire country an apology. Isn't it ironic that Paula Jones owes Bill Clinton what she in fact demanded from him? Indeed, isn't everything about a witch hunt ironic, when the rule of law comes to bear? Isn't the effort to turn Dick Morris into the John Dean of the Whitewater scandal, a laughable, transparent fraud? Black is not white and white is not black. Service justice my friend. Service justice well because if you do not, anybody can call you a murderer, and instead of substantiating the charge, they will simply compare you to other murderers and demand a confession. Confess and die fast, defy and die slow. Guilty today, or guilty tomorrow. You will be confined and the switch will be pulled. Your body

will convulse and your eyes will pop. Justice for one, justice for all.

Resist the temptation to label and destroy. To borrow Mary Bono's repeated boast, this is not the work of lawyers. This is not a defense for Bill Clinton. This is simply a reflection of every single, reasonable person who is sick and tired of all the bullshit and you can take that poll to the bank.

Hi Richard-
Where did you read Bob's 80 column
upgrade article? Is it in electronic format
somewhere?

>It was like hitting a wall at ~2.1 mHz. Nothing I could do would even
>get the system to boot at that speed.

I started a very long reply to this, and got knocked off AOL after I was 90%
done. Grr!

So here is an abbreviated version...
Most software that would be useful with an accelerator wouldn't need display
list capability. So another display device should be quite usable. But even
so...
The VIC II in a C64 will not run even at 2 MHz in a C128 running in C64 mode,
so it would seem that the Super CPU doesn't depend on flogging the VIC II at a
higher clock speed. I can't say that the VIC II is as
closely embedded with the 6510 as the 6502 and Antic are, but I think that the
similarities are far greater than the differences.
I subscribe to Commodore World, published by CMD (developers of the Super CPU).
They have had a number of articles about the SCPU, but none go into great
technical detail.
There was an article in Computer Shopper maybe in the late 80's that explained
how a 4 MHz C64 accelerator was developed. It did
have enough technical details to understand what was happening. I know I still
have it around here somewhere...
But a long story short.. I don't think that you have to clock Antic at a higher
speed, but even if the display device did have to be clocked at X MHz, then an
alternate could be used. An alternate display device would make it more
complicated and costly.
It would be interesting to have Mr Woolley
give us his thoughts on this.
Merry Xmas all,
Larry

First off it seems rather suspect that all three should quit at the same time--maybe you've got a problem with the computer or the RT8 handler code.

What kind (upgrades, etc.) of computer and what software are you using?

John

I have a 800 system that I am Trying to rehab and so far have been very disappointed with the video output so I would like to hear from someone who has actually made an S-Video cable for their 800. I have finally got the pinouts for the s-video connector, there are only four the chroma, luminance, and the grounds for each of them, however the Atari doesn't have those grounds so do I just ground to the shield?? Or do I use the Audio ground?? or what?

Thank You for any assistance

In a few ways I have to agree.

Hehehe... The Doctor (Sylvester McCoy) dies on the operating table. We
always knew his companions would be the death of him. :)

Actually during Sylvester Mccoy they hinted he was Merlin in a later
regeneration... or was it a alternate universe? (He certainly seemed to
understand a lot about magic didn't he?)
And then there was that remark made to Ace "If you knew what this man
had done, you would not be associating with him now."
Hmmm...

I know it's not on your list, but I have a copy of "6502 Assembly
Language Programming", by Judi Fernandez, Donna Tabler, and Ruth
Ashley, copyright 1983 John Wiley & Sons, Inc.

It's a self teaching guide, described on the back cover as,
"self-paced and self-instructional, and the coverage is eually
applicable to Apple, Atari, and Commodore microcomputer - in fact to
any machine based on the 6502."

It's in like-new condition, and practically an antique in computer
terms. Make me an offer.

Hehehe... you've got to find a common point.. something the Atari has
that can be found on the Atari in it's own form. It they are a trekkie,
a good round of Star Trek games. For kids... how about the ole Seseme
Street games?

I've gotton people enjoying Atari usually by two player games. Joust,
Wizard of Wor, Archon.. etc!

So the question I have for the sake of the Webbrowser, which seems
like it's going to be a nice piece of hardware as well as software is,
is it possible to build a 64K cartridge that can also hold a ram portion
as well?

Yep, I'm again wondering what we can cram in a cartridge case.

Doctor Clu

I remember my first experince with Star Raiders. Must have been 1979,
I was eight, and I was at Franklin Electronics in Dallas.

An Atari 400 was set up with a large screen television.

The game started, stars were shooting by. I saw asteriods, and thought
it was a 3D version of Asteriods. I went around shooting them till I
would hit them head on and get destroyed. I thought THAT was the game.
;)

Can we have a fuller and more developed discussion here on the various breasts to be found between the chins and waists of the many female Dr Who assistants?

It seems to me the topic has been sadly neglected down the years in the serious fanzines and other publications, no doubt for entirely spurious reasons of political correctness, and here at last in the armpit of Usenet that is the 8-bit newsgroups we can thrash the matter out to our mutual satisfaction.

PS: girlies need not participate.

I am getting rid of some Atari 8-bit software. To avoid having to deal with many trips to the postoffice to send out single items, I am bundling the software into 4 packages. I am asking $20 for each bundle, which includes shipping. Simply email and tell which bundle that you are interested in.

Bundle #1
Atari BASIC Book (Albrecht, Finkel, and Brown)
Atari Basic Ref. Manual
Atari Basic Cart
Microsoft Basic (Box/Docs)
Microprint Printer Interface
Flight Simulator II (Box/Docs)
Scenery Disk 5 (Box/Docs)
Star Scenry Disk - San Fran and Bay Area (Box/Docs)

Bundle #2
Star Fleet I (Box/Docs)
Animation Station (Drawing Pad/Box/Docs)
Decision in the Desert
Ghost Hunter (Cassette) - (Box/Docs)
Ninja (Box/Docs)
LA Swat/Panther
Tobot/Bros (Box/Docs)

Bundle #3
Drag (Box/Docs)
F-15 Strike Eagle (Box/Docs)
Access Triple Pack - Raid over Moscow, Beach Head, and Beach Head II (Box/Docs)
Party Quiz - 4 player trivia (Controller/Box/Docs)
Graphix AT - Printer Interface (Docs)
Centipede Cart
Galaxian Cart

Bundle #4
Gauntlet (Box/Docs)
TrailBlazer (Box/Docs)
Infiltrator (Box/Docs)
Run for the Money (Box/Docs)
Super Huey (Box/Docs)
Meltdown (Box/Docs)
Elektraglide (Box/Docs)
Temple of Apshai (Box/Docs)
Orbit - A Trip to the Moon (Box/Docs)

Are you sure that was a capacitor that blew? I mean, if he smelled smoke maybe it was because he got his cigar caught in the drive slot (or, got caught with his cigar in the slot).

I suspect "DC3" stands for "Disk Communicater 3.3" i.e. Bob Puff's DiskComm. Other file extenders commonly used for such files are ".DCM" (probably the most common) and ".DSK" (suggested in the documentation by the program author).

There are programs available to convert them to ".ATR" or ".XFD" format files and, of course, DiskComm itself will create a real disk from them. I suggest you check the APE home page or the Emulators directory in the UMich archive.

Cvendel says...

> The idea of adding memory via SIMMS is attractive, however the speed upgrade is
> not likely, The ANTIC and the SALLY (6502c) are directly tied to one another
> and its unlikely that the ANTIC will work at any speed other then the 1.79,

When you have a card like this, ONLY the Simms are used by
the new processor on the turbocard. To make the memory
visible to the other chips (e.g. the videochip) a part of
the Simm-Ram is mirrored to the original RAM every genuine
clockcycle (if it is 1.79 mhz of the original frequency and
your turbocard runs 20Mhz it happens about each 10th cycle
of the turbocard).
At least this is how CMD made it on the C-64.

I have my MAC/65 translation of it (Charles Marslett released it in RA65
assembler syntax).

I also have the source for several mods I made to DOS and DUP to do things
like turn cartridges and BASIC on or off from the menu, provide a 800XL
mini-RAMdisk, change the number of digits in the directory display, etc.

If you want them let me know (they're on a SpartaDOS format ATR which I
could ZIP and, if necessary, UUE for you. That's the only you get them in
any kind of hurry.

Hi. I read your post the other day about a Atari BBS's and I believe that you grabbed a few from my BBS. Just wanted to point out for accuracy's sake, that I actually think many of those BBS's are no longer in service. (esp. the ones that are listed from 1200/2400 baud) Those numbers came with the BBS lister program I'm using on my BBS, not from me...Some of them could still be in service though, I suppose.

BTW, I think this is something that needs to be done (an updated BBS listing), so thanks for the effort... ;-)

Hope you had a great holiday! ;-)

Isn't the speed of the Atari 1/2 the clock speed of the color burst signal? 3.5XXMHZ? Therefore, I think you would need to operate on a speed that is a multiple of the 1.79MHz speed and divide down from there for the other chips....

Of course, pulse widths an such would suffer...

tony

I say so. I witnessed it on antional TV with my own eyes and ears.
Real simple. You lie under oath you have committed purjury. That
happened. If that is not GALACTICALLY OBVIOUS to you then you need
serious help.

>That is the question and it not entirely facetious because it goes to
>the heart of "specific intent". In particular, perjury is a specific
>intent crime that relies upon the mindset of the defendant. When, for
>example, Monica Lewinsky said she hadn't had a sexual relationship

Don't try to spew this babble BS. He lied. He knew he was lying. He
knew what the information the questions were after. He lied both in
intent and in technical verbage. Multiple times I might add. The
most important thing to this president has been, is, and always will
be his own personal selfish interest first before all else. His bacon
being saved is all that matters.

Also, truth in our courts is a basic pillar of our very form of
goverment. It's protection is vital. With little or no penalty for
untruths in the courts our entire system collapses. I know that
sounds severe but think about it. It really is true. It doesn't
matter who does it needs to be punished. But when a president does

it, the damage to our society is so much more greatly amplified, yet appogists like you who want to place politics and policy before integrity and justice would wish to apply a lesser standard.

In summation: you make me sick.

test with a voltmeter on the board to make sure rthe batteries have a
good connection to the board. Also, you want about 3 volt. I
replaces my lithium disk with a 2 AA battery pack. works great.

With the board exposed and battery side up the chip on the right is a 74HCT138n, this more than likely is causing the problem. Your chips more than likely have the numbers ground off.

The chip on the left is a M3002-16PI. Not likely this is your problem though.

You will need either the old Discom, or Discom3. If a file was done in the first format, it would give errors in the last two versions.

Alternatively, though it's a longer download, one can try to get an ATR
file as well. Those should transfer fine for emulators and with an
ATR to disk utility.

Just for the record, perjury is lying under oath with the intent to
obstruct justice, which leaves open, I believe, lying under oath to
prevent self-incrimination. Of course, I have not done any real
reschearch into the matter, just some cursory investigation. Just
make sure that when you say something that it is backed by fact, not
the media, which can be ignorant of the law at times.

Atari to PC TV Tuner People...,

I have tried connecting my 800XL to my Matrox TV Tuner and achieved rather weak results. The signal from the Atari is either too strong, too weak, or simply not right. I set my tuner to standard tuning mode and turned it to channel 3. I had my XL set to channel 3 also. What I got was a very "snowey" picture with the colors being very weak. Thinking there might be something wrong with the XL I put it on my Sony TV and it worked great. I believe at this point that the tuner in the Matrox card is either cheap or defective. Anyhow, if anyone out there has luck with this venture let me know.

Too funny! Sounds good to me though!

Honestly, as we all know, the Doctor as a character tended to look
beyond the outside appearance of his companions and treat his companions
either with high respect or in a childlike jeering sort of way.

I respected the Doctor very quickly for this attribute... for back when
I first started watching the show I wondered why he didn't whisk the
lovely companions to the edge of time and space and then make out with
them in the many rooms of the TARDIS.

Naturally Susan was a bad choice, being his "Grand Daughter", Barbara
was with Ian, Dodo was true to her name, Victoria was a girl (and Jamie
probably had a thing for her).
So now we are up to the dashing third Doctor.
Liz!! Hehehe... Probably the first really great looking companion to
come across the Doctor's path. Nice set of legs, and a great brain to
boot. So great a brain that she out thought herself off the show.
Jo Grant awesome companion. If anyone wants a link to the website with
the nude photos I could probably find it. :)
Sarah Jane Smith... was moderately good looking. :)

So not to take up the conversation too much.. since I still have five
more Doctor's to cover.. what do you think of the commentary so far?
Of the companions of the third Doctor, Liz was the best overal!

Sorry bout that. :)

Alright, we're talking about make a web browser cartridge. Roughly 64K
or more. And then people talk about needing additional ram space as a
buffer and hinted at a cartridge form. We have, most of the time, one
cartridge slot. So, which this train of thought, is it possible to have
a cartridge that is part temporary ram, and part rom?

I think you missed the irony.

The long-running Dr Who thread which I took to a very extreme sexist
position by my posting has no place in *any* 8-bit newsgroup. It is
completely off-topic.

It belongs in one of the many Dr Who groups (if it belongs anywhere at al).

My god, you mean you want groups to discuss thing related to the group
name..

Fantastic invention old chap...

I doubt if you will make it fly though.

Seriously tho, Daleks may well be cracking bits of plastic with a bloke
inside but I didn't join a Dr Who group, If I wanted Dr Who I would
visit Jasons (TMR) web site...

Lets get back onto eachothers own topics.. eh nice people..

Hi-
What is arcre40g.com? Is it an A8 program?
I was only aware of 2 archive programs for
the A8. The original Arc by Ralph Walden,
I believe. And Super Arc by Bob Puff.
Of course there was ALF by Alfred (Jeff
Williams?) Oh, I just remembered, there was
also the arc program in Sparta Dos X. Is this
perhaps what this one is?

The 'Who groups have drifted into the area of eight bit computing more
than once (and sometimes it wasn't me who started it... =-). Anyway,
Doctor Who *is* on topic for most of the eight bit groups, the BBC and
C64 got Mines of Terror, the Spectrum, CPC and C64 got Dalek Attack, a
BBC Micro was used to supply graphics for the TARDIS and the intercom
noise for UNIT (Five Doctors) and the list goes on...

In short, lighten up a little Brian, it's Christmas... =-)

5484. Re: System Roms in the binaries group

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-27 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <36863E4D.C2150C7A@erols.com>
Source record: 56952

A message from Dr. Clu in that other newsgroup got me thinking.

This newsgroup is for discussion. The other one is for posting binaries. Oftentimes, people who post here to announce files they've posted in the other place often leave out the name of the other place (see, I do it too!) The result is that newbies are left scratching their heads about what that other place is for. Dr. Clu let me know that he wonders if the other place is for Atari discussion or for spam.

On the 16-bit side, there's alt.binaries.atari and alt.binaries.atari.d, and a clearly-written charter states what they're for. I believe the same is true on the 8-bit side. There is one difference, however. The ST side probably still has anti-spam bots working, because those two groups either come up with files or are silent.

I don't have the facilities or knowledge to create and maintain such a bot, but I wonder if anyone else out there could do it for alt.binaries.comp.atari8bit? (There, I've said it!)

Hah, bumhug (or something like that) :-)

I don't give a 2p-from-the-Christmas-pudding if the Dr Who stuff *has* an
8-bit connection, but the particular thread to which I responded had been
wibbling on for ages *exclusively* on scarves and Skaro and suchlike that it
occurred to me that the participators might not have noticed how off-topic
they were.

I do have a kill-file capability, but am reluctant to slow down the
reception of every batch of news by adding too many lines to it.

Happy New Year all, by the way. Just thought I'd get that in early...

I'm using SpartaDosX 4.22. Could be that my computer isn't providing
proper voltage to the ECI port. I have a 512k ram upgrade, SuperVideo, and
the CSS three-way bootable OS.

I am powering this 130XE off a PC power supply, though.

I'm out of ideas. Its frustrating having Rtime8 carts that don't work..

Thanks, Bob! I do have the chip on the right, although the last character
is an "E", instead of an "N". The chip on the left appears to have been
"sanded", as there are no markings.

Where can I get the 74HCT138E? Is this a radio shack type part?

Being an Atari 8bit person and a C64 peep I tend to be in those two
groups as well. Sadly the old Dr Who thread is rampant in all the 8bit
NG's..

Shame its not about the games ;)

Btw comp.sys.sinclair...Mr Goring may well have some strange sexual
fantasies (one involving a bear from a speccy game?) but he is Ok
really...trust me....

IIRC: This was from Thompson Electronics ~$150. General purpose, read everything from 2716s to 27128. A few problems with it were things like only having a 21V programming pulse, but I modified mine to work with 12.5V EPROMs. Cheap ZIF socket on top, 4K of cartridge ROM which was decoded odd so it had one image at $7000-$7FFF, mirror image at $6000-$6FFF. Pretty much a standard menu setup up like DUP.SYS, small debugger built in.

Everything was potted in epoxy so you couldn't reverse engineer it. Not that anyone would want to. $150 was a little pricey even then compared to what you could get on the clone side. But it was great for making a few cartridges, put SpeedScript on a cart for instance.

He has given a few details about where he would like to go, but the level of sophistication is somewhere around SNES to an Apple IIGS as far as speed & compatibility go.

Thing is, both of those probably took several million to develop & more then a few dozen man years. It is really more work then one person can do.

One of these days I may try to get back into doing some soldering. Hung up my soldering iron 3-5 years ago<???>. I was never good at complicated projects, but the mundane projects I did were kind of fun.

5502. atari xl/xe hardware emulator?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-28 00:00:00 UTC

Source record: 56839

why i post this letter? because i'm not enraptured with the sound emulators produce... xl-it! produces the clearest sound but only synt music not digital/sampled, atari800 produces both synt and digital but it chirps/crackles, xformer too...
so i ask you - can't anything be done to make pc sounds like a real atari? maybe pokey emulation should be rewritten or written once again with new algorithms? or a simple device could be build? anyone is good at electronics? i'm sure there are a lot of people!

that's all i want to say...

btw: you may ask: "why da hell you need so pure and clear sound?!?"... then i ask: "because i love demos and i love atari music - i save it as mp3 files and listen to it all the day :)"

see ya, best greetings

[atari xl/xe fan]

ps. i have k6/233 so don't tell me i have slow computer that's why the sound rattles :)
ps. has anyone made a hardware atari xl/xe emulator on a standard pc-card?

5503. off topic, but...

I just tried out "Montezuma's Return" for Color Gameboy. It's really a good and accurate updating of the old "Montezuma's Revenge" game for Atari many, many years ago. I reccomend it enthuastically. Just thought you all might like to know.

(Rtime-8 power source.)
I did that too. I just soldered wires to the points on the RT8 board.

Then I attached a two AA batery holder from Radio Shack to the
wires. It has worked fine. It is sorta unsightly, with the
wires coming out of the RT8 and the battery holder sitting on
the bench.

(J. King can't get BB to recognize some hard drives.)
Nope, never had that problem.
However, my 2 cents, keep the cables short (less than a foot.)
Be careful plugging in and out the cables, the pins bend.
Finally, hdfmtph you use. One worked for me (was it 6?),
the others didn't.

Hi,
Just a quick note to say that I've put up my new Web Site of my computer collection -
it includes around 50 machines, with fast-loading graphics inc. manual covers, set-up diagrams,
plus a link to my 3D Model pages (inc. ZX80 & ZX81).

Hope you like it. I'd be happy to include links to other collectors and to list any for-sale items.

Thanks and Happy New Year,

Tony Brown

>How did you do that? Do you have this dual AA battery pack taped to
>the outside of the cart? Hard-soldered to the board?

Okay what I did was buy at Radio Shack a little plstic battery holder
that holds two AA batteries. On the end of it it has nubs like a 9
volt battery has. I also bought a piece that plugs on to a 9 volt
battery (or in this case my 2 AA pack) and has a red and black wire
leads coming off of that. I removed the old disc lithium battery from
the RTime. I drilled a small hole in the Rtime to allow those two
wire leads to pass through. The hole is in the back half. I soldered
the leads to the appropriate spots on the PCB in the RTime. I then
put in to 1.5v batteries in the pack, and plugged on the leads onto
the end. 3 volts supplied to my RTime and easy to change. Last quite
a while too. Even though they aren't lithium batteries, they are much
larger so do last. I just set the battery pack on top of the 800XL
right behind the cart.

Easy peasy Ja.... ahhh never mind. :)

That's an MIO format utility, isnt it? I've been trying to use,
HDFMT.COM, as provided with the black box diskette.

Darn! So does this mean we *won't* go on about the various companion's chests? I had some great pics (none nude) of Liz, Peri, Tegan.... ah well...

>AHEM!< Well.. how about those games? ;)

Off hand I don't know any Atari games, besides a version (I think) of the Dalek game (based off the age ole "Droids" game).

In the realm of the Z-games (the same language the infocom games were written) there is a game called "Karn", which is a text adventure story which picks up where the "Brain of Mobius" left off.

Hmm.. perhaps some Doctor Who games need to be written for the Atari in 1999. :)

Doc Clu

Source record: 56979

The two versions are identical except for the number of digits returned by the directory function. 4.53/3 uses only three digits for lengths <1000 whereas 4.53/4 simply restores things to the previous MyDOS norm of four digits.

The switch to three digits was supposed to increase compatibility with stuff written for Atari DOS 2.yuck. The problem is a lot of software now expects to get four digits if it finds a "M" at $0700. If, for example, you try TextPRO with 4.53/3 the menu will be screwed up.

(Asks if hdfmtph6.com is MIO utility.)
Ok, yes, it is for MIO. I don't know if it would work with
BB and you should probably use the hdfmt that came on the
BB disk. There were 3 or 4 hdfmtph I got with the MIO
disk. The hdfmtph6.com worked for me.

Have you tried Atari800win...

Very good sound IMHO..

Even most samples sound very good and Im from the old days too :)

Dos port has same sound capabilities

Hmmm just reread this and it seems you have tried the Atari800win and
the Dos version (hopefully the apm version included in the archive)

>so i ask you - can't anything be done to make pc sounds like a real atari?
>maybe pokey emulation should be rewritten or written once again with new

>electronics? i'm sure there are a lot of people!

Any extra hardware is normally a put off, people who are non electronics
minded tend not to want to build these things hence people don't write
the code for them

Me, Im from an electronics background so its Ok for me but I understand
why some want pure software emulation.

As for software coded stuff, well Rich has done a superb job so far but
you have to remember he is writing this free emulator for all needs,
there are still some older PC-wise owners who hassle him for code
running in a 386 etc...it not so much hinders his code but does make it
harder to please all..

Im running a P233MMX so I hope Rich and Co do not make the code so that
only a PII can run it..Yes, I am greedy :)

er pass...I know there is a C64 on a card but not atari..

Nice idea but the current Atari 'owners' seem to want to hold onto the
hardware and not let anyone add to it.

You may want to get the following books:

TCP/IP Illustrated, Volume 1
The Protocols
W. Richard Stevens

TCP/IP Illustrated, Volume 2
The Implementation
Gary R. Wright
W. Richard Stevens

They will tell you pretty much all you'll ever need to know.

>I know there is a C64 on a card but not atari..

Do you have any info on this? There was a commercial product (Trackstar)
that was an Apple II+/e on a card for the IBM,
but I've not heard of another. (Ok, there was
an Apple II hard/software emulator for the Mac.) There was an article about
one in AIM, and even a presentation about it at the 1991 Chicago Atari fest,
but never heard anything more about it. I think that the
software emulators killed any chance of a
hardware emulator.

233 isn't all that fast by todays standards. I'm not saying that it
is SLOW, but it isn't FAST either.

5535. atari8-l mailing list - solution for all the wtb/fs posts

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-29 00:00:00 UTC
From: maciej grzeszczuk <krap@zwieracz.ideefixe.nom.pl>
Message-ID: <76aevdiqr1@zwieracz.ideefixe.nom.pl>
Source record: 56853

hi

first of all - sorry for bothering you via private email, but i think
that is's imporant that all atari8 related persons could easily discuss with
each other.

i'd like to present probably the biggest mailing list for 8bit atari
computer users nowadays. when on comp.sys.atari.8bit there are lot of
wtb/fs posts, and almost none of the real discussion, on atari8-l we're still
talking about the new things for our favourite computers.

latest topics are 65c816 extension (there is one developed by one
of the subscriber), tcp/ip stack, unix for 8bit atari, and many more...

to subscribe, mail a message to majordomo@zwieracz.ideefixe.nom.pl, with the
following line in the body (not the subject) of your message:

subscribe atari8-l

i think it's worth to be subscribed (for now there are over 100 subscribers from
all around the world).

if you can, and want to, please subscribe, and of course share this message
with your friends using 8bit atari, so that all atari users could easily
contact each other.

5536. atari8-l mailing list

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-29 00:00:00 UTC
From: maciej grzeszczuk <krap@zwieracz.ideefixe.nom.pl>
Message-ID: <76afn1$k9n$1@zwieracz.ideefixe.nom.pl>
Source record: 56854

echlo

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest mailing list in the world - connected bidirectionally
to old list at MARIST, and gatewayed to the FidoNet international echo ATARI8-L.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there
is no old-messages deleting, and so on... my wish is that all atari users
would be subscribed, so the atari community stay together and grow in
strenght.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl
with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable,
regularily maintained.

please, share this message with all people that are interested in atari8
topics you know.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

I like Atari800win's sound very much. In fact the only time I noticed a glitch on my PC with an old 16 bit Soundblaster card is at the beginning of Shamus and the Hitchcock theme music. Everything else seems like sound on my Atari.
I know of an emulator called "Pokey" that has an option to use an actual Pokey chip connected to the PC, maybe through the parallel port, IIRC.

maybe you right... however i think we could try... it isn't as complicated
as pc mainboard and probably everyone knows an electrician/hobbyst who
could build some simple device

> Me, Im from an electronics background so its Ok for me but I understand
> why some want pure software emulation.
of course pure software emulation is more awaited but software will never
be 100% hardware. if you want perfect emulation only hardware makes it
possible. am i wrong, huh?

> As for software coded stuff, well Rich has done a superb job so far but

well... uae works pretty fast... amiga is much slower (in performance) than
atari is so atari emu should run fast like thunder... don't you think?
i consider p100 should emulate atari/c64 at normal speed. god! it is 32bit
cpu, many times (1000x ???) faster than atari!!! [one more thing: emulators
aren't written in micro$oft - they don't have slow-down code]

cheers

I get my best sound running the Atari800 emulator for DOS. The windows emulator is considerably slowed by the cheap and old video card and the long-latency sound card (Creative AWE 32 non PNP). But digitized sound just doesn't come through. It has probably has little to do with the pokey routines. BTW, the K6 processor, I've been told, doesn't like Creative sound cards -- not that having such a card will improve your situation.

So far, the best emulator for the Atari 8-bit is an Atari 8-bit!

All the internet standards (TCP, IP, PPP) are documented in what are called RFCs (Request For Comment). I beleive www.internic.org (or .net) has all the RFCs available online. IP is defined in RFC 791; TCP is defined in RFC 793.

Hope this is of some help.

5547. Re: atari xl/xe hardware emulator?

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-29 00:00:00 UTC
From: Anthony Baker <antbaker@arn.net>
Message-ID: <368908EB.E65D9840@arn.net>
Source record: 56865

Hello,

Actually, a P100 (standard Intel w/ no overclocking) is "only"
56.17977528 times faster than an Atari 8-bit standard CPU.

Another thing is, on Atari800Win, When I run it at 640X480 mode and try
to do sound and then test it, I get a message that my computer is not
fast enough to get fast sound at that screen mode and I have a P133
overclocked to a P180. What's up w/ that?

Also, if you are so unhappy w/ emulation but want all the games, just
buy an Atari 800XL (personally my FAVORTIE 8-bit) 1050 DD (w/ DOS) and a
SIO2PC cable and copy stuff over to the REAL 8-bit. I am sure someone
in this newsgroup would be willing to sell you that combo of stuff
cheap.

If you do that, you won't have to worry about emulation because you'll
have the real thing and still get the programs you want!

Laters,

antbaker@arn.net

I have recently got back into Frontier - Elite II. The original game was unstable
and slow on my old 386DX back in 93, but now with an AMD-300 it really flies, and
new patches available off the net fix quite a few bugs (plus don't use continuous
music). Running under Windows 95 enables you to quickly recover from lockups too.

I wonder if Frontier will be made PD anytime soon?

- that brings us back to an old question - how come Elite was never ported to
the Atari. - it made it the C-64, Plus 4, MSX, Spectrum and others, but never an
Atari version.

Graham.

I had one of those printers, but it broke. I used to go to Office Max
and they had ribbons for it there. Of course you probably already
checked stores, guess I am not much help.

Hiyas all -

I recently download Atari800Win (ver 2.5) and have played Ali Baba
successfully but now I'm trying to get Ultima III to work but cannot.

I can get the intro up and running just fine but when i try to start
the game it crashes and I get a message about changing hardware
settings. Well, I've tried many combinations of settings and ROM's but
it still doesn't work.

Can anyone clue me in to the proper settings to get U3 to work? I'm
not really that familiar with all the Atari ROM's and OS's and such so
a *beginner's* explanation would be much appreciated.

TIA!

How do you came to that value ? :-)

The ANTIC and GTIA chips have hardware functions that are very hard to emulate.
The fastest PC-CPU today can't emulate the ATARI with all peripherial chips in
realtime !!! :-))

>If you do that, you won't have to worry about emulation because you'll
>have the real thing and still get the programs you want!

yes! i think its the only perfect way the next few years...

>cpu, many times (1000x ???) faster than atari!!! [one more thing: emulators
>aren't written in micro$oft - they don't have slow-down code]

Emulation is always a tricky business. The fact that the Atari has so
many custom IC's that need to be emulated makes the job much harder.
So yeah a primes benchmark written for both platforms native, the
intel chips are going to smoke the good ole Atari8, but emulation is
more resource demanding.

Message-ID: <76c4g9mpc3@mohawk.hwcn.org>
Source record: 56876

Ok, I am considering getting rid of my Black Box Floppy Board. Now, I know that Floppy Boards for the Black Box are in short supply. I don't think you can even purchase one new from C.S.S. right now. So, don't ask if I will sell the Floppy Board Separate. I won't.

I have two Black Boxes. One has the Floppy Board, the other does not. I know people want the Floppy board. However, I do not want to be stuck with an extra Black Box if I sell it. So, here is the deal. Not really a deal, just what I paid. I will sell the following as a package.

Black Box $200
Black Box Case $40
The Floppy Board $150

Grand total $390 US funds.

I will also throw in an Adaptec 4000a and MFM hard disk Mechanism free of charge. Shipping and insurance from Canada extra. Payment with International Money Order in US funds only.

Source record: 56878

There were discussions in alt.binaries.sounds.midi a year or so ago (I haven't checked since then) but it seems that AMD, Cyrix, etc. processors just don't get along with Creative Labs sound cards. People were buying AWE64s and having trouble making them work. Just which models of the Creative sound cards caused those problems, and if the problems still occur today, I can't say. I have no info about the K6-2 interractions with sound cards, either.

Sorry.

You know, that's an interesting point, and one I've brought up before.
Actually, the advantage of a mailing list is that there's less
opportunity for spam to get in. But spammers seem to be hitting the
inactive groups more than the active ones. So, what's the solution?

Could it be that off-topic gossip is preferable to silence if it gives
the illusion of activity and makes it less likely that spam will enter
the newsgroup? Of course, that's seldom necessary here :)

5567. REQ:Atari Fuji symbol for my PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-30 00:00:00 UTC
From: onlyinohio@aol.comN0spAM
Message-ID: <19981230113519.02212.00004330@ng28.aol.com>
Source record: 56885

Hi folks, I was brought up on the Atari 400/800 and have a number of demos that had the Fuji symbol. Some had rotating colors, some were 3D, and some even rotated the entire symbol.

Does anyone know where I could find a large Fuji symbol like that to use as the opening screen in Win95? Or as a screen saver? I've looked all over and can't find one anywhere. Would have thought with the Atari's continued popularity somebody would have ported over a 3D Fuji to the PC.

Any help appreciated.

5568. Re: S-Video cable for 800XL

Newsgroup: comp.sys.atari.8bit

Source record: 56886

The monitor jack on the 800 is the same as on the XL and XE series.

You would have to run sound to a separate amplifier, like your stereo or a pair of powered PC speakers. I have built monitor cables before with a built-in "Y" connector on the sound output to hook it up to both inputs of a stereo.

Brent

> a cartridge that is part temporary ram, and part rom?

It should be simple to do.There were Atari VCS cartridges that did what you
describe.Since there's no R/W line on the cartridge port you need to have the
RAM at two addresses.One for reading and one for writing.
(or have the bank-select register control this but the former sounds faster)

> know about Remembrance...

Actually it was pretty obvious that Daleks could traverse stairs for a long
time.You see Daleks on different decks of the Marie Celeste in "The Chase".
And the fact that *NONE* of the characters ever try to use stairs to escape
daleks.And that hover-field means that daleks can traverse terain that would be
hard for humans to.

And for you Trekkies that are laughing at the "Daleks vs. stairs" problem;
what about the "Borg vs. bullets" problem?
(and the total lack of any anti-missile technology from ships)
Any why do the Borg in Voyager look different than the Borg in TNG?
(not to mention the second TNG movie)

>The monitor jack on the 800 is the same as on the XL and XE series.

Someone mentioned that their picture was in
black and white. The 800XL has no Chroma
output, does it? That would require a minor
upgrade to bring the Chroma out to the jack.

As for sound, I use a "mini amplifier" from
Radio Shack (About $13.00). Works great.

That's right. I forgot, I've installed the Super Video upgrade in all the machines I use anymore, so I just swap them around without thinking about it. You can fudge and use the composite signal as chroma, or you can bring the chroma out pretty easily (it's a one-wire mod iirc), or you can do the Super Video upgrade, which I highly recommend. Someone has been putting the instructions for the Super Video upgrade on a web page; if you're interested, do a web or dejanews search.

The XE series has the chroma restored and some fixes to the botched video amplifier design of the XL series, but still has some problems---see the Super Video XE upgrade in the same issue of Atari Classics.

You are in a limited group. Your computer can read cartrigdes but not disk Dos files as most are in 48k format. Your computer reads all as 16k unless it has been upgraded. Go to Basic and type in Print Free (0) and if it comes up with less than 39.???? then you have a 16k machine and you will not be able to do much unless you upgrade it to 48k..

Hello. I want to first thank each person that replied. I appreciate your help. Please allow me to further explain my situation. I am wanting to connect my 800XL and many other older computers and video game sytems to my PC, which has a video card with composite video, S-Video, F connector (cable TV), and left and right audio RCA jack inputs. It also has an output for composite video, S-Video, and a 1/8" stereo plug for sound. I have bought a Sound Blaster Live Value and will be using it as a sound card. I am trying to figure out what will be the best way to set up a bunch of computers and video game systems. I have around 25 different of each, but I would like to be able to hook up some of them at least.

Thank you,
Jason Whorton

There is a R/W line on the Atari 8-bit computer cartridge port as well as on the VCS cartridge port. In fact, the bank selects on OSS 16K cartridges for the 8-bit computers and on the "Supercharger" expansion unit for the VCS were both controlled by writing to a location on the cartridge.

Source record: 56907

Hi,

I downloaded them and all play perfectly fine on my system. I guess you have a problem with the samples (since all pieces contain samples) but they are perfect on my system - at least as perfect as samples on a pokey can get (nice mix in that "My body, your body" demo). So, I guess the problem lies in your system or the emu you use. Please note that only the Allegro version of the DOS Atari 800 plays samples. The regular DOS versionï¿½s pokey update speed is not high enough for samples. This limitation does not apply to Atari800 Win, but of course you need a good system for Atari 800 Win to run full steam.

I have almost perfect pokey sound (the only thing I miss is the high-pass filter in one or two cases...) with Atari 800 Win (and the Allegro DOS version, for that matter) on my P2 450 with an old non-PnP AWE 32. For your demos (and also normally) I used 48 Khz, a Pokey devisor rate of 2 and an 800XL PAL system setting.

I guess your problem really is a too slow PC - sound is affected first. Try out the Allegro DOS version - but beware, it is much slower than the regular DOS Atari 800.

Oh, and please donï¿½t forget that none of the emus supports the later European 2-Pokey-Stereo hack which many demos use nicely. But, Atari 800 could add that optional second Pokey soon...

Hope this helps,

Julian

Source record: 56908

Hi Bo,

Your problem lies in your assumption that bit maps are always
256 bytes in length--they are not. Bit map length is measured
in sectors without regard to disk density, so the bit map on
a SD disk is 128 bytes and on a DD or QD disk it is 256--in
both cases, 1 sector. Only ED requires a second bit map sector
to map the final 16 of 1040 sectors.

Your $06 byte is not in the bit map--it is in the first directory
map and is the low byte of the sector number for the first directory
data sector. (With ED, you would get a $07 here.)

Obviously if you change it, DOS is going to look at the wrong sector
to read the directory info. Since the odds are the sector is empty,
DOS gets a string of $00 bytes for the directory name.

Best of the season to you and yours,

John

5591. fortunately emu sounds ok now!!! :)

The TARDIS didn't make sense.Why,when the Doctor was returning the Master's
remains to Galifrey,did a monitor have displayed on it
"Destination:Time Of Rasilon"?
(or something to that effect)
That's like a human getting a criminal like Sadam Husein and deciding to take
him back to the days of Jesus Crist.
Not to mention how much *UN-LIKE* the real TARDIS it actually looked.

And what's all that "Eye of Harmony" business about?
The Eye was a black hexagonal (?) monolith with cables/hoses/conduits coming
out of it and going Rasilon-only-knows-where.It had a black star ("Black Hole")
inside of it.There certainly wasn't any way of "opening" it.In fact,it couldn't
leave Galifrey or else both it and the planet would be destroyed.

And why does gravity let you walk through windows?

> Street games?

Amazing that kids pay so much money for GameBoy games seeing as how it has
worse graphics than the Atari home computer system.Gameboy only gives you
144x200x4 monochrome.It's only merit is that it has 4-shade sprites.I'd just
love to see what you could do by way of Zelda (or Pokemon!) on a Atari with one
of those gigantic cartridges.(some as big a 256k!)
Someone could make a adaptor to plug GameBoy cartridges in to the Atari.
(not too hard since the GameBoy's cartridge address space is only 32k)
Then someone could write Atari games that loaded their graphics and sounds
off of the GameBoy cartridge for display in 160x200x4.And you could have
different palettes for different levels/maps/cities/dungeons as well as
different palettes for different sections of the screen.
(like in Pokemon on the Super GameBoy)
Not to mention how we can blow the GameBoy away with HIP mode.
(HIP=160x200x31 monochrome text/graphics GTIA mode)

> I've gotton people enjoying Atari usually by two player games. Joust,
> Wizard of Wor, Archon.. etc!

All favourites of mine!
But you forgot Zybex.And don't forget 4-player games like Asteroids and
that Zombie/Maze game from Antic/Analog/whatever magazine and Dandy.

Now to get a 4-player DynaBlaster ("Bomberman") with APAC/CVIEW/JVIEW/HIP
playfields.
(along with humble GR.15 & GR.8 graphic modes,and their text countparts)

Probably not since this newsgroup is for the Atari home computer system,
not the ST or any other Tramiel Technology system.

But in answer to your question,the ST uses a standard RS232 port so it should
work.But the ST's "VT52" seems to have little to do with VT52 terminals.
So setting your IBM terminal emulator to "VT52" won't work.
(Neither does it work for the Atari)

Using device drivers rather than directly accessing the hardware for sound?
That's a new one on me.
And I thought that DirectX was supossed to provide direct access for games.

I assumed it worked like on the Amiga (the *REAL* sequel to the Atari HCS)
where you asked a "resource" for permission to access some piece of hardware
so that other programmes (including the OS) would leave that
hardware/chip/sound-channel alone.Of course the OS couldn't actually *DO*
anything to prevent other programmes from accessing the hardware so
other processes would have to consult with the "resource" that handled
that hardware to see when it became freed up.So if a process was using the blitter
directly,windows couldn't be re-drawn until it freed up the blitter
resource.So games either had to free-up the blitter resource every so often,
or (more usually) they ran to the exclusion of all other processes.

(reminds me of file-locking under UNIX)

> and i don't think creative's drivers are optimized... is m$ windoze
> optimized? of coz it isn't...
> m$'s and other big companies don't have time to optimize anything - people
> always want a new version of the software and the campanies don't have any
> time to code/rewrite them - they just add some code and change the version
> number... that's all
> [i know assembler quite good so don't threat me as a lamer]

I never liked Microsoft.They never gave MS-DOS (originaly QDOS) the features
it really needs.Like interupt vectors being fixed up when a programmes gets
killed by control-break or a stack error or some such.And no support
for expanded or extended memory,nor protected mode.No inter-process
comunication or control.The list goes on and on...

And just look at Microsoft BASIC on the Atari.I guess they didn't think
that being able to do device-specific things liked read directories or use RS232 ports or print sideways.They implemented a OPEN command that obviously takes up more code than Atari's OPEN command but that lets you do less.And without a XIO command there's no way to read more than one byte at a time.
(say goodbye to BURST I/O)
And you can't use variables in a GOTO or GOSUB command.

And they left out the commands that I bought MicrosoftBASIC for.Like DRAW and PLAY and SOUND.IF they can do it on the Colour TRS-80 Computer in 16k then why not on the Atari.
(and remember that Atari has it's own graphical routines where as Colour BASIC has to do the graphics it self,though some commands would probably have to directly access video memory to be fast)

5598. PC drives in 1050

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-31 00:00:00 UTC
From: cv436@torfree.net
Message-ID: <F4uBCt.Etx.0.queen@torfree.net>
Source record: 56795

Is it possible to use 360K 5.25" floppy drive mechanisms in the 1050 disk drive? Not that I expect to get 360K density. Just that I've got a bunch of these PC drives which I would hope could replace a broken 1050 mech when one of mine finally do pop a gasket.

My assumption is that the drive mech is using the shugart standard, but then again this is a computer which has lots of non-standards. :-)

Later...

Wow! what a cool site. You are really doing some neat stuff with your
Atari's... and I've been considering writing Win32 programming and disk
management tools for some time -- excellent work. I can't believe this is the
first time I've heard of your site. BTW: what are you using for your eprom
burner? I'm looking to get one, and don't want to spend a fortune. Any
recommendations?
Thanks,
Dan Vernon

I don't really think there was much of a point, unlike in the VCS.
Moving stuff to and from bank-switched RAM is pretty slow. A RAMdisk
cart with flash RAM would be kind of cool though. I've seen plans for
16K battery-backed CMOS supercart emulators.

> The SuperCharger can tell whether you're reading or writing by the

I just checked again and you're right about this. Not having a r/w
line on the cartridge port of the 2600 was really weird.

Daniel Klugh:
> The TARDIS didn't make sense.Why,when the Doctor was returning the
> Master's remains to Galifrey,did a monitor have displayed on it
> "Destination:Time Of Rasilon"? (or something to that effect)

Destination:
Gallifrey

Local Dateline
5725.2
Rassilon Era

It's rather like giving a date as 1999AD, the 5725.2 being an
unspecified measurement of time from the time of Rassilon.

> Not to mention how much *UN-LIKE* the real TARDIS it actually looked.

Except the resemblance to the secondary console room and the fact that
the TARDIS interior can easily be adjusted, you mean...?

> And what's all that "Eye of Harmony" business about?
> The Eye was a black hexagonal (?) monolith with cables/hoses/conduits
> coming out of it and going Rasilon-only-knows-where....

All TARDISes are powered by the Eye (when Omega drains the power from
Gallifrey the ability to Time Travel is affected) so logically they have
to have some kind of connection to it, that's not the *actual* Eye, in
the same way that the monolith in Deadly Assassin wasn't the Eye itself,
it's a "portal" to the real Eye, at a guess via the time/space vortex.

> And why does gravity let you walk through windows?

The Doctor says: "You see, already the molecular structure of the planet
is changing... ...at first in subtle ways but soon in catastrophic
ways" and walks through the window. The Eye being open is affecting
everything around it on a molecular level.

Now, if you want a *really* difficult question to answer, when the
police rider zooms into the TARDIS, how come he A) doesn't hit the
console and B) manages to bunny-hop the bike back up the small flight of
steps by the door on the way out...? =-)

Hi Paul,

> Now the related question, Factor 5 did a nice followup to Ball Blazer,
> what happened to the Rescue on Fractulas idea. Seem to remember it being
> demo'ed at E3 or something?

So youï¿½re the one person who actually liked BallBlazer Champions (if thatï¿½s the update youï¿½re referring to - there is another one on the Amiga called Masterblazer, which basically just was BallBlazer in higher res and 50 FPS) :).

Basically, the fact that BallBlazer Champions sold between ten and eleven copies (which is a bit unusual for LucasArts games these days) didnï¿½t help our Fractalus update much. The technology we developed for it can be seen on the N64 in Star Wars: Rogue Squadron - which happens to be our most recent released game at this point. I hope that we can develop it further (and also get a few design elements from the old Fractalus update design revived) in our next game with LucasArts.... but donï¿½t hold your breath considering the turn-around cycles for games these days.

Cheers,

Julian

5607. Offer from Schrooge (sp?)

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-31 00:00:00 UTC
From: BobKlaas <bobkla19@sisna.com>
Message-ID: <368BF6CE.80FAEB52@sisna.com>
Source record: 56804

Here is an after Christmas offer from me to the Atari 8-bit Comunity.

If you purchased something from me in 1988, that has cease to work and you want it working again. Take it apart, (saves shipping weight) send me the mother board, inner board ect, and for you pay shipping both ways will repair the item. Send me a copy of the invoice with the item and a check to cover return shipping. I will repair it and send it back to you in good working order.

I do appreciate those of you that have supported the Atari 8-bit comunity and those that have received items from myself. If at all possible will continue to offer deal in 1999 and beyond. In extension of this, if you have an item you would like repaired and are willing to disassemble it send me the boards, IE: disk drive, (with exception of atari 810), will fix what I can for $10.00 plus postage both ways. This offer is only good in the USA (Unless you agree to the postage returned back to you in form of IMO!), Money order or personal check is accepable in the USA. If International, send IMO and offer still applies.

Belated Merry Christmas, and a very Happy New Year to each and every one of you!!!!!!

Bob...Klaas....(not clause!)

5608. Printer Ribons!

Message-ID: <368BF889.937A12EF@sisna.com>
Source record: 56805

I know for a fact that very few of you in the Atari 8-Bit area have printers that take Cartridges, so there fore you are paying out big bucks for printer ribons!..

I will re-ink your ribons for $2.00 each return shipping paid on 3 or more. Atari Clubs send 24 or more at $1.50 return shipping prepaid my myself.

Re-inking is a mess, I also do cartridges for ink-jet, and bubble jet price varies on cartridge. Shipping on carts is usually $3.00 for Priority Mail.

Lance;

I know you are busy, semi busy through the holidays. But with the items I sent you. There are several areas you can open up to the Atari 8-Bit Community. If you have not even had a chance to look into it, here are a couple.

1. Pro_Term. Great way to expand it to a Cartridge, with features that would let the user logon to the Internet with Text only features?

2. Now you have BBS Express! Professional, you could look at making it compatible with those BBS's that have Internet access as far as e-mail goes.

3. Expand the Networking that was done with Corina, and possibly others?

4.I do hereby apologize to you for getting you into something I was totally aware of in the beginning! There is no stop to the requests that will follow this post to your programmers!!

5. But..honestly you have the staff in place to proceed where I couldn't or was reluctant due to extenuating circumstances.(You know as discussed before!) My very best to you and yours..

As a last-ditch attempt, you can open up the case and adjust the RF
output. There are two small screws accessible through holes in the cover
of the RF modulator. I say "last-ditch" because you have to be exceedingly
careful not to push the slug all the way through and out of the coil.

If you try this, use a non-metallic screwdriver and limit your
experimenting to about half a turn either way.

If you do push the slug out of the coil you can pretty well assume it's
not fixable.

We can all do that!!!!

I personally don't like the single chip version. I may work ok but i
much prefer the 2 chip version. I also had some spare sio male plugs
hanging around so I used one of those and a smll peice of vero board.
works very well. saves cutting up a cable.

Hey all, interested in tabletops/handhelds in trade. Or, I'll consider cash offers.

The games are all loose, and the titles are:
Centipede
Dig Dug
Congo Bongo
Q*Bert
Robotron 2084
Jungle Hunt
Pole Position
Star Trek
Missle Command
Basic Computing Language
Donkey Kong
Donkey Kong Jr.
Caverns of Mars
Kickback
Joust
Star Raiders
Jumpman Jr.
Moon Patrol
Qix
Ms. Pac Man
Super Cobra
Popeye
Gateway to Apshai
Defender
Gyruss

That is all. thanks

5623. SpartaDos format question

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-31 00:00:00 UTC
From: bo.schreurs@stackbbs.xs4all.nl
Message-ID: <915066169@stackbbs.xs4all.nl>
Source record: 56912

Hi all,
first of all, a Very Happy New Year to all Atarians.

Now my question ;)
I�m currently expanding my DIR2ATR program
(which turns a pc directory into an .ATR XL/XE disk image)
to have it produce SpartaDos .ATR disk images.
For a single directory it works, but I�ve encountered
a little problem.
Although somebody mailed me some docs about the SpartaDos
format, I know I�m still missing some vital info.
Maybe somebody can help me.
There�s is a particulair byte position I�m interested in.

If we have a SpartaDos disk with just 1 bitmap sector,
which is 256 bytes in size (on a 128 bytes/sector or
256 bytes/sector disk, doesn�t matter), it seems that
byte position 133 must be hexadecimal 06, why is that?
What does this byte position mean?
And, if we have 2 bitmap sectors, do I have to set the
133 position of the second bitmap sector to hexadecimal 06?

Below will follow a hexadecimal dump of the bitmap sector:

```
00 7F C0 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 FF FF FF FF FF FF FF FF FF FF FF FF FF
FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF
FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF
FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF
FF FF FF FF FF FF FF FF FF FF 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 06 00 00 00 00 00 00 00 00 00 00 00 <-- see "06"
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
```

If position 133 is "00" for instance, SpartaDos won�t
give a correct directory listing when requesting a DIR.
It shows 8 heart characters for the directory name.

If it is "06" it works fine.
Any help is appreciated here.

Bo.

: No prompt or anything. I dont have any cartridges for it, but atari basic
: should come up automatically, Right? Is there anything I could do to fix it,
: or is it a lost cause? thanks.

An operating 600XL should display a blue screen with READY prompt at power up. Typing BYE [RETURN] should run a self test.

If I were you I'd try a few tests. Look into the cartridge connector and make sure there are no bent or shorted pins (also inspect the SIO and joystick sockets). To open the case, turn the computer up side down and remove the four screws in the corners. Turn it right side up again and lift off the keyboard half. Lay the keyboard over to the right with its cable connected. Turn the machine on and verify 5VDC at the power input connector if possible. Touch each chip after a few minutes operating time. If any are more than moderately warm it might mean a chip has failed. The most likely cause is probably a bad RAM. In a stock 16K 600XL they are U11 and U12. The type is probably 4416 or equivalent. If a 64K modification has been done there might be soldered jumper wires or a small board that plugs into U11 and U12 sockets with other chips mounted on it. Good luck.

Steve

This is really a software issue. The actual problem is that many
Creative drivers make bad (well, I guess it depends on your viewpoint)
assumptions about processors and have code written specifically for
them. Namely, they often use highly optimized assembly code that
really depends on how a Pentium or Pentium II pipelines.

Except in rare cases (analog components) it is very possible to write
software emulation that is 100% accurate to hardware. ROMs are nothing
more than software that has been permanently stored in silicon in the
first place.

>i do understand it... i just wanted some emu with as good snd emu as
>possible

If this is what you desire, help Ron Fries with his Pokey emulation
routines. Nobody even touched the problem before Ron, and I think he
did an amazing job.

Ron has already identified the major issues that keep his Pokey
routines being perfectly accurate. They are:

1) No high pass filter (yet).
2) 17bit polynomial is simulated by random numbers instead of table
look up - unless you have brilliant hearing, I very much doubt you
could argue this as a negative.
3) Emulated chip uses perfect square waves instead of decay based
signal of original Pokey.
4) Aliasing caused by non-matching output frequencies.

>cpu, many times (1000x ???) faster than atari!!! [one more thing: emulators
>aren't written in micro$oft - they don't have slow-down code]

This has very little to do with anything. Many DSP chips are 64 or
even 128bit and run at staggering cycle rates, yet they would have no
hope whatsoever of emulating an Atari. They slice bitfields at
incredible rates but their ability to do multiple register operations
is about nil.

It generally takes an order of magnitude superiority of processing
power to be able to emulate an original CPU faithfully, and the
emulation platform has to be of similar design (both CISC chips for
instance). With the Atari you have the added drawbacks of what amount
to multiple processors and a rigid syncronous operation between them
that requires considerable attention. It's my belief that the Atari is
without question the most complicated 8bit system to emulate.

Given all of the above, in terms of raw processing power, you aren't
going to be able to equal an Atari until you reach the 386/33 level of
CPU, assuming everything was written in pretty tight assembly. Write
it in C or even just attempt to make an open architecture
programmatically and you push yourself into the 486 range.

Add to this a requirement for 50 to 60 hz refresh rates of
approximately 90K per screen, since the graphics systems nowadays are
very different from the 8-bit world. Just about no cards for a 386
will do this, AND it chews up CPU, so you are now firmly into the 486
range of power.

Throw Windows into the mix, and you are into a Pentium range
requirement. No, it's not because of some fantasy that Microsoft
writes consistently horrible code or that they deliberately slow
things down (the later is simply ridiculous, the former varies
considerably depending on the task). It's because Windows 95 is
attempting to multitask and therefore constantly interrupts the
processor, all the time, so that it can do other things besides your
program. This is the real and fundamental difference between DOS and

Windows that laypeople do not understand. It is not trivial to have
the processor halt what it is doing, shuffle off all of its registers,
load in registers from the next guy, run off in his address space for
a bit, and then go through the whole shebang to get back to you again.

-Rich

Source record: 56919

(Bo S. tries to figure out what the '6' is at offset 133 in
the bit map sector.)
I dunno. Straight up.
I think the 6 is the actual first directory sector. Byte
9 (starting at 0) of the first 128 byte sector is supposed
to be the first sector of the MAIN directory.
This byte seems to always be one less than these 'mystery'
bytes associated with the bit map sector(s).
Truth (maybe) ICD had confusion about how many sectors were
to be 128 bytes, two or three. Just like I run into when I
try stuff with SpDOS.
I checked atr images from 92k to 3.9 meg.
These 'mystery' numbers tell the actual sector(s) offset(s)
of the MAIN directory. They are found in the bit map sector
for 92k img (sector 4). For larger disk images, these
numbers are in the next 256 byte sector from the bit map
sector.
I did an extractor to extract files from .atr images to
files on my pc.
I cludge thru the offsets, adding 256 bytes here and there.
Because offsets don't come out right if I don't cludge thru
it.
You find, in bigger images, like 06 00 07 00 08 00 09.
If I check the MAIN, it goes to sectors 6, 7, 8, and a
little of 9.
I think ICD cludged the thing and fudged by writing the
actual MAIN offsets after the bit map sector(s).
That's what I think, and I spent hours trying to figure it
out. And I read and re-read the books I have on SpDOS, and
could not find any mention of these bytes.
Russ
(The thing in programming SpDOS is to fiddle around with
offsets til they come out right. It is my pound on it 'til
it works hammer and anvil approach to programming.)

5631. Syquest EZ135 Config on BB

Newsgroup: comp.sys.atari.8bit

From: jeking@NOSPAM.COM
Message-ID: <76f27i$8c$1@news.xmission.com>
Source record: 56920

Okay, I have an internal Syquest EZ135 SCSI removable hard drive.

It's configured as Drive0 (no jumpers installed), the 50 pin ribbon cable is correct, and my info from Syquest indicates that it has 16 heads, 512 sectors.

First, the blackbox only goes up to 15 heads. When I try to enter 16, it defaults to 0. Second, even if I select 15 heads, I am unable to hit the drive via my black box.

What's the configuration information that I need to enter into the blackbox? This Syquest works, as I pulled it out of my PC.

Thanks in advance!

I see nothing significant about this byte. it shows as 00 on all my Spartados disks unless those sectors are allocated.

Within the last year, I saw that Radio Shack has Atari games, brand new.
They are not in the store, but they can order them for you. Ask them if you
can look at their catalog, which includes Sony, Nintendo, and Atari games.
They are shipped directly to your house.

Jared Perkins wrote in message
<20071-36868A7A-183@newsd-253.iap.bryant.webtv.net>...
do you know if you can still buy atari games, preferably still in the
box?

> what it would be like on Atari.

You usually use a single disk for quite a while.In Ultima 2 you use the same disk for everything except for when you're in space.(which is seldom)
In Ultima 3 you just use the same disk through out the game.
In Ultima 4 there's one disk for when you're outside,one for inside,and one for dungeons.But 4 supports two disk drives.(why not three?)

Of course by "disks" I mean "disk sides".And all four Ultima games have a seperate "Programme" disk for booting from,after which you never have to touch it until the next time you re-boot the game.

And remember to keep a back-up of the "B" disk (the one you use for being outside&inside on Earth) or else you won't be able to start a new game.You should do the same for the second disk (side) of Ultima 2.You can still start a new game in Ultima 3 but the monsters that were wandering the country-side will still be there since Ultima 2 & 3 remember the monsters wandering around outside when you save the game.
(I've never seen a Nintendo game do that!)

> digits.

Well the number is the number of sectors in the file (like on the Apple),not
it's actual length in bytes*125 (or 253).A ten byte file could take up ten
sectors (if created with DOS 2.0;MyDOS fixes this "feature") just as a UNIX
file could take up 10 sectors but be a million bytes "long".
(CP/M & Commodore DOS do the same thing)

> The switch to three digits was supposed to increase compatibility with
> stuff written for Atari DOS 2.yuck. The problem is a lot of software now
> expects to get four digits if it finds a "M" at $0700. If, for example,
> you try TextPRO with 4.53/3 the menu will be screwed up.

I never understood this.Since the programmes you mention (and many others)
Don't actually use this information for anything,why do they break?
Since all DOSes return the same number of bytes for each directory-entry,
just use the filename/extention (always in the same place) and blindly display
the rest in menus.And,of course,ignore or simply display the last line.
(which shows the number of free sectors)
The situation isn't helped by the 800 OS manual's lack of instruction on how to
compatibly access DOS.

Also MyDOS creates problems with software that assumes that only normal
(non-inverse) upper-case text will be used for file-names and hence show the
directory listing in coloured-text mode.
(which shows different coloured normal upper-case text in place of
upper-case and/or inverse text)

5639. New ASSI crossassembler - beta version released ! (freeware!)

Newsgroup: comp.sys.atari.8bit
Date: 1998-12-31 00:00:00 UTC
From: macfalkner@aol.com
Message-ID: <19981231051250.23603.00001605@ngol01.aol.com>
Source record: 56928

Hi atarians!

Im searching for atari assembler programmers wich want to test my new PC cross assembler.

You should test my new ASSI - ATARI (6502) Cross Assembler wich runs on PC under W9x . An P100 (640x480) is recommended. You should also have some additional software like filelister, emulators and/or SIO2PC and others...

For the ASSI.ZIP file look at: http://members.aol.com/MacFalkner

An english html.doc is available the next days. Furthermore i will add some examples of sourcecode for the special assembler features.

Please give a feedback if you find bugs or if you have other suggestions.
If i have no feedback, take this as final version !

thanks,
bye, Andri¿½

A happy new year to all ATARI freaks !

MacFalkner@aol.com

yeah... it is software problem. what cpu has to do with pc cards?
nothing...
and i don't think creative's drivers are optimized... is m$ windoze
optimized? of coz it isn't...
m$'s and other big companies don't have time to optimize anything - people
always want a new version of the software and the campanies don't have any
time to code/rewrite them - they just add some code and change the version
number... that's all
[i know assembler quite good so don't threat me as a lamer]

Well I just looked at the 130XE cartridge port pin-out in "Mapping The Atari"
and it seems to have a R/W line.Too bad no games ever had any RAM in them.

The SuperCharger can tell whether you're reading or writing by the address you
use.Basicly one of the address lines becomes the R/W line.

Ultima IV on the Atari was one of the best RPG games released for it. With 2 disk drives swapping is minimum (Esp compared to Alternate Reality).

But be prepared for a long quest. I dont think the game consoles emcompassed 1/2 of what was required on the computer series.
